Trends in DNA Fingerprinting Research M. M. Reade,2005 DNA Fingerprinting is a method of identification that compares fragments of deoxyribonucleic acid DNA It is sometimes called DNA typing DNA is the genetic material found within the cell nuclei of all living things The techniques used in DNA fingerprinting also have applications law and law enforcement palaeontology archaeology various fields of biology and medical diagnostics In biological classification it can help to show evolutionary change and relationships on the molecular level and it has the advantage of being able to be used even when only very small samples are available This book details several applications of this break through technique

Forensic Practitioner's Guide to the Interpretation of Complex DNA Profiles Peter Gill,Øyvind Bleka,Oskar Hansson,Corina Benschop,Hinda Haned,2020-06-10 Over the past twenty years there s been a gradual shift in the way forensic scientists approach the evaluation of DNA profiling evidence that is taken to court Many laboratories are now adopting probabilistic genotyping to interpret complex DNA mixtures However current practice is very diverse where a whole range of technologies are used to interpret DNA profiles and the software approaches advocated are commonly used throughout the world Forensic Practitioner s Guide to the Interpretation of Complex DNA Profiles places the main concepts of DNA profiling into context and fills a niche that is unoccupied in current literature The book begins with an introduction to basic forensic genetics covering a brief historical description of the development and harmonization of STR markers and national DNA databases The laws of statistics are described along with the likelihood ratio based on Hardy Weinberg equilibrium and alternative models considering sub structuring and relatedness The historical development of low template mixture analysis theory and practice is also described so the reader has a full understanding of rationale and progression Evaluation of evidence and statement writing is described in detail along with common pitfalls and their avoidance The authors have been at the forefront of the revolution having made substantial contributions to theory and practice over the past two decades All methods described are open source and freely available supported by sets of test data and links to web sites with further information This book is written primarily for the biologist with little or no statistical training However sufficient information will also be provided for the experienced statistician Consequently the book appeals to a diverse audience Covers short tandem repeat STR analysis including database searching and massive parallel sequencing both STRs and SNPs Encourages dissemination and understanding of probabilistic genotyping by including practical examples of varying complexity Written by authors intimately involved with software development training at international workshops and reporting cases worldwide using the methods described in this

Trends in DNA Research Corey R. Woods, 2006 Deoxyribonucleic acid DNA is a chemical found primarily in the nucleus of cells DNA is a long spiralling molecule that orchestrates the cell's daily operations and provides the genetic blueprint for the physical characteristics of all living organisms It is the molecule that encodes genetic information in the nucleus of cells It determines the structure function and behaviour of the cell DNA is made up of two complementary strands the strands intertwine like a spiral staircase to form a structure called a double helix Subunits called bases are the rungs of the staircase The four nucleotides in DNA contain the bases adenine A guanine G cytosine C and thymine T This new book presents leading edge research in this dynamic field
