be predicted. In no instance do we feel that pneumothorax has resulted in an acceleration of the disease process.

CONCLUSIONS

Although we realize that the figures presented are not conclusive, yet we feel that they are

definitely indicative of the value of artificial pneumothorax in adolescents. Our results are similar, in most respects, to those published by others. We have been able to arrive at certain conclusions from this study:

1. Sex is an important factor, the female adolescent responding less favorably to collapse therapy than the male adolescent. In this we differ from the conclusions of Brock and Mullen, referred to above.

2. The amount of disease with which an individual is admitted to the sanatorium is the most important factor influencing the prognosis of both sexes, even with effective pneumothorax.

3. Artificial pneumothorax therapy is the method of choice in adolescents.

4. In our series 68 per cent of the patients with effective pneumothorax are at present considered as having a favorable prognosis, while only 34 per cent of a control group of patients of the same age group receiving only routine sanatorium care are classed as having a favorable prognosis.

MEDICAL PROGRESS

PROGRESS IN HEMATOLOGY*

Late 1934 and 1935

BY WILLIAM DAMESHEK, M.D.†

INTRODUCTION

ADVANCE in hematology continues unabated. The intimate association of the blood cells with almost every conceivable type of bodily disorder is becoming increasingly apparent, making the study of the morphology of the blood in a given case almost imperative. As pointed out in last year's review, hematology has gone a far way from the mere study of the morphology of the blood cells, being now concerned with most of the organs of the body. Thus, a problem in vascular disease of the extremities may resolve itself into a case of polycythemia vera; the occurrence of multiple xanthomata leads the investigator into the study of blood cholesterol and its relation to the reticulo-

endothelial system; the hypermetabolism of lymphatic leukemia causes speculation on the problem of hypermetabolism in general; and, of course, the importance of the gastrointestinal tract in the pathogenesis of many cases presenting anemia is becoming ever more apparent. Hematology has thus definitely loosened the morphologic shackles which once bound it and has, in response to the times, become increasingly physiologic. It becomes, therefore, more generally apparent that there are in reality no diseases of the blood per se, but rather that various disorders are present in which the blood-forming organs have become implicated.

BLOOD-FORMING ORGANS

Interest in study of the bone-marrow during life has become nothing short of extraordinary. In the past year alone two monographs have been written on sternal puncture: one by Elsa Segerdahl (*Acta med. Scand. Supp.* 59:173, 1934), the other by Nils G. Nordenson (*Generalstabens Litografiska Anstalts Förlag Stock-*
