Last, 2012-12-06 Prior and subsequent to the publication of the third edition of the Diagnostic and Statistical Manual of Mental Disorders DSM III we have witnessed a considerable upsurge in the quantity and quality of research concerned with the psychiatric diagnostic process There are several factors that have contributed to this empirical influx including improved diagnostic criteria for many psychiatric disorders increased nosological attention to childhood psychopathology and development and standardization of several structured diagnostic interview schedules for both adult and child populations With the advent of DSM III R and in anticipation of DSM IV diagnostic labels and their definitions have been in a state of change as evinced by the many refinements and modifications currently taking place However the basic purpose or *raison d'être* of the nosological scheme has not been altered Psychiatric diagnosis is the means by which we classify or categorize human psychopathology

And as is the case in the medical arena psychiatric diagnosis serves three central functions classification communication and prediction As research accumulates our understanding of psychiatric disorders increases and we are in a much better position to classify reliably and with validity as well as to communicate and predict Despite periodic changes in the diagnostic system the basic strategies for conducting diagnostic research e g genetic family studies biological markers follow up studies etc do not vary appreciably over time But in over one decade no scholarly book has appeared that tackles the essential research issues involved in upgrading the diagnostic endeavor
