### **Progress In Optics Volume Xxxiv 34:**

Progress in Optics ,1995-12-01 This volume presents a review of the research in several areas of modern optics written by experts well known in the international scientific community The first chapter discusses properties and methods of production and detection of coherent superpositions of macroscopically distinguishable states of light the so called Schrodinger cat states Chapter two deals with the phase shift method which originated in the 1930s for the analysis of potential scattering problems in atomic and nuclear physics Recently this approach has been applied to wave propagation in one dimensional inhomogeneous media Chapter three is concerned with the statistical properties of dynamic laser speckles that arise from scattering objects with rough surfaces undergoing translation and rotation A moving phase screen model is employed which gives a relatively simple formulation of the theory and a clear picture of the time varying speckle phenomenon The fourth chapter presents a review of the more important theoretical and experimental results relating to optics of multilayer systems with randomly rough boundaries The significant theoretical approaches which make it possible to interpret experimental data involving such systems are described and relevant methods for optical characterization of systems of this kind are outlined The last chapter presents an account of a theory of the photon transport through turbid media

*Quantum Decoherence* Jean-Michel Raimond,Vincent Rivasseau,2006-12-18 This volume is devoted to Quantum Decoherence with lectures from the S minaire Poincar held in November 2005 at the Institute Henri Poincar Paris The goal of this seminar is to provide up to date information about general topics of great interest in physics Both the theoretical and experimental results are covered with some historical background Particular care is devoted to the pedagogical nature of the presentation

**Optical Methods for Data Processing in Heat and Fluid Flow** Clive Greated,John Cosgrove,James Buick,2002-08-30 Optical methods are now used routinely for the measurement of velocity concentration temperature and other parameters in wide ranging areas of industrial research and design such as IC engines turbines and combustors Recent advances such as the use of high resolution CCD cameras and the extension of flow mapping to three dimensions make optical tools such as particle image velocimetry increasingly viable for use in the industrial environment This excellent book presents new developments in optical diagnostic techniques in heat and fluid flow and offers an unparalleled opportunity for industrialists and academic researchers to exchange ideas

CONTENTS INCLUDE Comparison of injector sprays for gasoline direct injection engines The design development and preliminary results from a high speed optically accessed single cylinder engine The reflected spectrum of complex multi layered inhomogeneous highly scattering medium Development of full volume digital holography for particle measurement Improved liquid crystal thermography by using true colour image processing technology Development of an optical measuring technique for the study of acoustical phenomena Spatio temporal reconstruction of the unsteady wake of axisymmetric bluff bodies via time recording DPIV Application of particle image velocimetry to helicopter vortex interactions Pulsed laser particle image velocimetry using a fibre optic delivery
