

01

Selectivity

The solvent should be able to dissolve the desired compound (the analyte) much better than it dissolves the other components of the mixture.

02

Immiscibility with water

In most cases, the solvent should be immiscible with the liquid that contains feed. This means that the two liquids will not mix together, and they will form two distinct layers.

03

Boiling point

The boiling point of the solvent should be relatively low. This is because the solvent needs to be evaporated in order to recover the analyte.

Properties of Solvents are Useful for Solvent Extraction

04

Chemical reactivity

The solvent should not react with analyte or the other components of mixture. If the solvent is reactive, it can degrade the analyte or form unwanted products.

05

Viscosity

The viscosity of the solvent should be low. This is because the viscosity affects the rate of mass transfer between the two liquids.

06

Density

The density of the solvent should be different from the density of the feed. This will help to make the two layers more distinct and easier to separate.
