Proprietes Spectrales des Algebres de Banach B. Aupetit, 2006-11-15 Spectral Theory of Linear Operators and Spectral Systems in Banach Algebras Vladimir Müller, 2013-11-11 Spectral theory is an important part of functional analysis. It has numerous applications in many parts of mathematics and physics including matrix theory, function theory, complex analysis, differential and integral equations, control theory and quantum physics. In recent years, spectral theory has witnessed an explosive development. There are many types of spectra both for one or several commuting operators with important applications, for example, the approximate point spectrum, Taylor spectrum, local spectrum, essential spectrum, etc. The present monograph is an attempt to organize the available material, most of which exists only in the form of research papers scattered throughout the literature. The aim is to present a survey of results concerning various types of spectra in a unified axiomatic way. The central unifying notion is that of a regularity, which in a Banach algebra is a subset of elements that are considered to be nice. A regularity R in a Banach algebra A defines the corresponding spectrum $\sigma_R(a)$, $a \in A$. E_C is a regularity in the same way as the ordinary spectrum is defined by means of invertible elements $a \in A$, E_C is a regularity. Axioms of a regularity are chosen in such a way that there are many natural interesting classes satisfying them. At the same time, they are strong enough for non-trivial consequences, for example, the spectral mapping theorem. *Canadian Journal of Mathematics*, 1989-12 **Invertibility and Singularity for Bounded Linear Operators** Robin Harte, 2016-11-16 Suitable for courses in functional analysis and a valuable resource for researchers, this introductory treatment is based on the open mapping theorem, Hahn-Banach theorem, dual space construction, enlargement of normed space and Liouville's theorem. 1988 edition.

Simultaneous Triangularization Heydar Radjavi, Peter Rosenthal, 2012-11-19 A collection of matrices is said to be triangularizable if there is an invertible matrix S such that $S^{-1}AS$ is upper triangular for every A in the collection. This generalization of commutativity is the subject of many classical theorems due to Engel, Kolchin, Kaplansky, McCoy and others. The concept has been extended to collections of bounded linear operators on Banach spaces; such a collection is defined to be triangularizable if there is a maximal chain of subspaces of the Banach space, each of which is invariant under every member of the collection. Most of the classical results have been generalized to compact operators, and there are also recent theorems in the finite dimensional case. This book is the first comprehensive treatment of triangularizability in both the finite and infinite dimensional cases. It contains numerous very recent results and new proofs of many of the classical theorems. It provides a thorough background for research in both the linear algebraic and operator theoretic aspects of triangularizability and related areas. More generally, the book will be useful to anyone interested in matrices or operators, as many of the results are linked to other topics such as spectral mapping theorems, properties of spectral radii and traces, and the structure of semigroups and algebras of operators. It is essentially self-contained, modulo solid courses in linear algebra for the first half and functional analysis for the second half, and is therefore suitable as a text or reference for a graduate course. **Brauer**
