

Propriétés optiques des matériaux : absorption, réflexion, réfraction, dispersion...

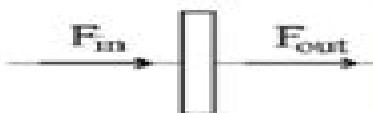

Les matériaux utilisés pour réaliser des composants optiques sont :

- ± **absorbants** (pertes énergétiques selon le trajet Flux ↓ si L↑)
- ± **réfringents** (déviation du faisceau au franchissement d'un dioptre,...)
- ± **réfléchissants** (pertes au franchissement d'un dioptre, images multiples...)
- ± **dispersifs** (trajet différents selon la couleur λ , ...)

- A facteur de perte par absorption $0 \leq A \leq 1$
matériau : opaque $A = 0$, transparent $A = 1$

Absorption : loi de Beer $F(L) = F_0 \exp(-\alpha(\lambda)L)$

Le flux de lumière traversant un cylindre de section constante décroît exponentiellement lorsque sa longueur L augmente avec $\alpha(\lambda)$ coefficient d'absorption (en m^{-1}) caractéristique du milieu de propagation.

Atténuation A selon l'épaisseur (sans unité) $A = \frac{F(L)}{F_0} = \exp(-\alpha(\lambda)L)$

Propriétés acoustiques des matériaux Parviz Navi,2006-01-01 Cet ouvrage présente tout d'abord les principaux éléments de l'acoustique physique et les bases analytiques nécessaires à la description du phénomène de propagation des ondes planes harmoniques. Sont traités les cas des fluides et des solides qu'ils soient homogènes ou hétérogènes purement lastiques ou visco-lastiques. A partir des modèles développés, les méthodes de caractérisation non destructive des propriétés effectives des milieux sont citées. Ces modèles appliquent la formule générale du transfert, qui constitue un puissant outil permettant de traiter la quasi-totalité des problèmes d'absorption et d'isolation rencontrés dans les matériaux de construction. En marge des préoccupations liées au environnement sonore, cette thématique concerne également les phénomènes vibratoires liés aux manifestations sismiques, les techniques mergentes de microscopie acoustique ou encore de contrôle de qualité *in situ*.

Source 4e de couverture : *Propriétés optiques et acoustiques des fluides comprimés et actions intermoléculaires*, Bellevue 1-6 juillet 1957 Centre national de la recherche scientifique (France), 1959 [Phenomena Induced by Intermolecular Interactions](#) G. Birnbaum, 2013-03-09 This book is concerned with recent experimental and theoretical work dealing with phenomena created by the transient dipoles and polarizabilities produced by intermolecular interactions. These forces produce absorption from the microwave to the optical regions of the spectrum and the latter produce Rayleigh and Raman scattering. Such absorption and scattering would be absent without collisions. Static properties such as dielectric constant, refractive index and Kerr effect also exhibit the effects of induced dipoles and polarizabilities. The first observation of an infrared absorption spectrum produced by the collisions of molecules which ordinarily do not have an allowed dipole transition was reported in 1949 by Crawford Welsh and Locke. The first observation of depolarized Rayleigh spectra due to collisions in atomic gases appeared in 1968 by McTague and Birnbaum. However, it was not until 1977 that the first conference dealing with collision induced phenomena was organized by J.D. Poll at the University of Guelph. This conference was mainly concerned with studies of collision induced absorption in gases. Light scattering received more attention at the second meeting of the collision induced community in 1978 at the Fermi Summer School on Intermolecular Spectroscopy and Dynamical Properties of Dense Systems organized by J. Van Kranendonk. However, the emphasis was still on collision induced absorption in compressed gases, although some work on liquids, solid H and related subjects such as rotational relaxation was included. Collision- and Interaction-Induced Spectroscopy

G.C. Tabisz, Murray N. Neuman, 2012-12-06 Collision or interaction induced spectroscopy refers to radiative transitions which are forbidden in free atoms or molecules but which occur in clusters of interacting atoms or molecules. The most common phenomena are induced absorption in the infrared region and induced light scattering which involves inelastic scattering of visible laser light. The particle interactions giving rise to the necessary induced dipole moments and polarizabilities are modelled at long range by multipole expansions at short range electron overlap and exchange mechanisms come into play. Information on atomic and molecular interactions and dynamics in dense media on a picosecond timescale may be drawn from the spectra. Collision induced absorption in the infrared was discovered at the University of Toronto in 1949 by Crawford Welsh and Locke who studied liquid O₂ and N₂. Through the 1950s and 1960s further experimental elucidation of the phenomenon particularly in gases continued and theoretical underpinnings were established. In the late 1960s the related phenomenon of collision induced light scattering was first observed in compressed inert gases. In 1978 an Enrico Fermi Summer School was held at Varenna Italy under the directorship of J. Van Kranendonk. The lectures there reviewed activity from the previous two decades during which the approach to the subject had not changed greatly. In 1983 a highly successful NATO Advanced Research Workshop was held at Bonas France under the directorship of G. Birnbaum. An important outcome of that meeting was the demonstration of the maturity and sophistication of current experimental and theoretical techniques.

Sont d'abord décrites les propriétés intéressantes pour l'emploi du matériau et sont expliquées

Sont notamment présentées les défauts qui influent sur cette évolution et les mécanismes qui l'accompagnent mouvement des atomes diffusion mouvement des dislocations mouvement des precipités coalescence transformations de phase Enfin en application pratique des différentes notions présentées et compte tenu du grand nombre de paramètres et de la variété des matériaux les pistes de réflexion sont présentées pour guider le métallurgiste dans son action de contrôle et d'évolution du matériau
