Semirings Automata Languages:

Semirings, Automata, Languages W. Kuich, A. Salomaa, 2012-12-06 Automata theory is the oldest among the disciplines constituting the subject matter of this Monograph Series theoretical computer science Indeed automata theory and the closely related theory of formal languages form nowadays such a highly developed and diversified body of knowledge that even an exposition of reasonably important results is not possible within one volume The purpose of this book is to develop the theory of automata and formal languages starting from ideas based on linear algebra By what was said above it should be obvious that we do not intend to be encyclopedic However this book contains the basics of regular and context free languages including some new results as well as a rather complete theory of pushdown automata and variations e g counter automata The wellknown AFL theory is extended to power series AFP theory Additional new results include for instance a grammatical characterization of the cones and the principal cones of context free languages as well as new decidability results *Automata, Languages and Programming* Luca Aceto, Ivan Damgaard, Leslie Ann Goldberg, Magnus M.

Halldorsson, Anna Ingolfsdottir, Igor Walukiewicz, 2008-06-24 ICALP 2008 the 35th edition of the International Colloquium on Automata Languages and Programming was held in Reykjavik Iceland July 7 11 2008 ICALP is a series of annual conferences of the European Association for Theoretical Computer Science EATCS which first took place in 1972 This year the ICALP program consisted of the established Track A focusing on algorithms automata complexity and games and Track B focusing on logic semantics and theory of programming and of the recently introduced Track C focusing on security and cryptography foundations In response to the call for papers the Program Committees received 477 submissions the highest ever 269 for Track A 122 for Track B and 86 for Track C Out of these 126 papers were selected for inclusion in the scientific program 70 papers for Track A 32 for Track B and 24 for Track C The selection was made by the Program Committees based on originality quality and relevance to theoretical computer science The quality of the manuscripts was very high indeed and many deserving papers could not be selected ICALP 2008 consisted of five invited lectures and the contributed papers

Automata, Languages, and Programming, 2005 Semirings and Affine Equations over Them Jonathan S. Golan, 2013-03-14 Semiring theory stands with a foot in each of two mathematical domains The first being abstract algebra and the other the fields of applied mathematics such as optimization theory the theory of discrete event dynamical systems automata theory and formal language theory as well as from the allied areas of theoretical computer science and theoretical physics Most important applications of semiring theory in these areas turn out to revolve around the problem of finding the equalizer of a pair of affine maps between two semimodules In this volume we chart the state of the art on solving this problem and present many specific cases of applications This book is essentially the third part of a trilogy along with *Semirings and their Applications* and *Power Algebras over Semirings* both written by the same author and published by Kluwer Academic Publishers in 1999 While each book can be read independently of the others to get the full force of the

theory and applications one should have access to all three This work will be of interest to academic and industrial researchers and graduate students The intent of the book is to bring the applications to the attention of the abstract mathematicians and to make the abstract mathematics available to those who are using these tools in an ad hoc manner without realizing the full force of the theory

A Guide to the Literature on Semirings and their Applications in Mathematics and Information Sciences K. Glazek, 2013-06-29 This volume presents a short guide to the extensive literature concerning semirings along with a complete bibliography The literature has been created over many years in variety of languages by authors representing different schools of mathematics and working in various related fields In many instances the terminology used is not universal which further compounds the difficulty of locating pertinent sources even in this age of the Internet and electronic dissemination of research results So far there has been no single reference that could guide the interested scholar or student to the relevant publications This book is an attempt to fill this gap My interest in the theory of semirings began in the early sixties when together with Bogdan W. Glazek I tried to investigate some algebraic aspects of compactifications of topological spaces semirings of semicontinuous functions and the general ideal theory for special semirings Unfortunately local algebraists in Poland told me at that time that there was nothing interesting in investigating semiring theory because ring theory was still being developed However some time later we became aware of some similar investigations having already been done The theory of semirings has remained my first love ever since and I have been interested in the results in this field that have been appearing in literature even though I have not been active in this area myself

Semirings and their Applications Jonathan S. Golan, 2013-04-18 There is no branch of mathematics however abstract which may not some day be applied to phenomena of the real world Nikolai Ivanovich Lobachevsky This book is an extensively revised and expanded version of *The Theory of Semirings with Applications in Mathematics and Theoretical Computer Science* Golan 1992 first published by Longman When that book went out of print it became clear in light of the significant advances in semiring theory over the past years and its new important applications in such areas as idempotent analysis and the theory of discrete event dynamical systems that a second edition incorporating minor changes would not be sufficient and that a major revision of the book was in order Therefore though the structure of the first edition was preserved the text was extensively rewritten and substantially expanded In particular references to many interesting and applications of semiring theory developed in the past few years had to be added Unfortunately I find that it is best not to go into these applications in detail for that would entail long digressions into various domains of pure and applied mathematics which would only detract from the unity of the volume and increase its length considerably However I have tried to provide an extensive collection of examples to arouse the reader's interest in applications as well as sufficient citations to allow the interested reader to locate them For the reader's convenience an index to these citations is given at the end of the book

Semirings: Algebraic Theory And Applications In Computer Science Hanns Joachim Weinert, 1998-10-30 This book

provides an introduction to the algebraic theory of semirings and in this context to basic algebraic concepts as e.g. semigroups, lattices and rings. It includes an algebraic theory of infinite sums as well as a detailed treatment of several applications in theoretical computer science. Complete proofs, various examples and exercises, some of them with solutions, make the book suitable for self study. On the other hand, a more experienced reader who looks for information about the most common concepts and results on semirings will find cross references throughout the book, a comprehensive bibliography and various hints to it.

Developments in Language Theory Oscar H. Ibarra, Zhe Dang, 2006-06-21. This book constitutes the refereed proceedings of the 10th International Conference on Developments in Language Theory DLT 2006 held in Santa Barbara, CA, USA, in June 2006. The 36 revised full papers presented together with 4 invited papers were carefully reviewed and selected from 63 submissions. All important issues in language theory are addressed, including grammars, acceptors and transducers for strings, trees, graphs, arrays, efficient text algorithms, algebraic theories for automata and languages, combinatorial and algebraic properties of words and languages, variable length codes, symbolic dynamics, decision problems, relations to complexity theory and logic, picture description and analysis, polyominoes and bidimensional patterns, cryptography, concurrency, bio-inspired computing and quantum computing.

Developments In Language Theory: At The Crossroads Of Mathematics, Computer Sci And Biology Grzegorz Rozenberg, Arto Salomaa, 1994-04-30. This proceedings volume provides a modern synopsis of recent studies concerning certain areas of language theory very close to applications. The topics covered range from image generation and developmental models to combinatorics of words and formal power series as well as from fractals to computational complexity. Although the contributions represent ongoing research, much of the material is accessible to a reader with only a moderate previous knowledge of the subject.

State of the Art in Computational Morphology Cerstin Mahlow, Michael Piotrowski, 2009-08-28. From the point of view of computational linguistics, morphological resources are the basis for all higher level applications. This is especially true for languages with a rich morphology such as German or Finnish. A morphology component should thus be capable of analyzing single word forms as well as whole corpora. For many practical applications, not only morphological analysis but also generation is required, i.e. the production of surfaces corresponding to specific categories. Apart from uses in computational linguistics, there are also numerous practical applications that either require morphological analysis and generation or that can greatly benefit from it, for example in text processing, user interfaces or information retrieval. These applications have specific requirements for morphological components, including requirements from software engineering such as programming interfaces or robustness. In 1994, the First Morpholympics took place at the University of Erlangen-Nuremberg, a competition between several systems for the analysis and generation of German word forms. Eight systems participated in the First Morpholympics; the conference proceedings [1] thus give a very good overview of the state of the art in computational morphology for German as of 1994.
