

In what has now become the standard model for sequence stratigraphy, a *depositional sequence* comprises an unconformity-bounded package of genetically related strata, whose internal geometries are influenced largely by fluctuating sea level (Fig. 1). This model evolved from regional mapping (Sloss 1963), and was later developed from seismic-reflection profiles on passive continental margins (Payton 1977). It was further extended to a higher resolution using data from the surface and subsurface in many geological settings (Mutti 1985; Wilgus *et al.* 1988; Van Wagoner *et al.* 1990). Here

we do not provide a comprehensive summary of the terminology that has grown-up around sequence stratigraphy: judging by its sparse usage within the papers of this volume much of it is redundant anyway. The interested reader should refer to the reviews of Haq (1991), Vail *et al.* (1991), Mitchum & Van Wagoner (1991), Posamentier *et al.* (1992) and Posamentier & James (1993) for further details. In essence, sequence stratigraphy is practised through the recognition of key surfaces which define the boundaries of packages of genetically related strata (*systems tracts*) and by the recognition

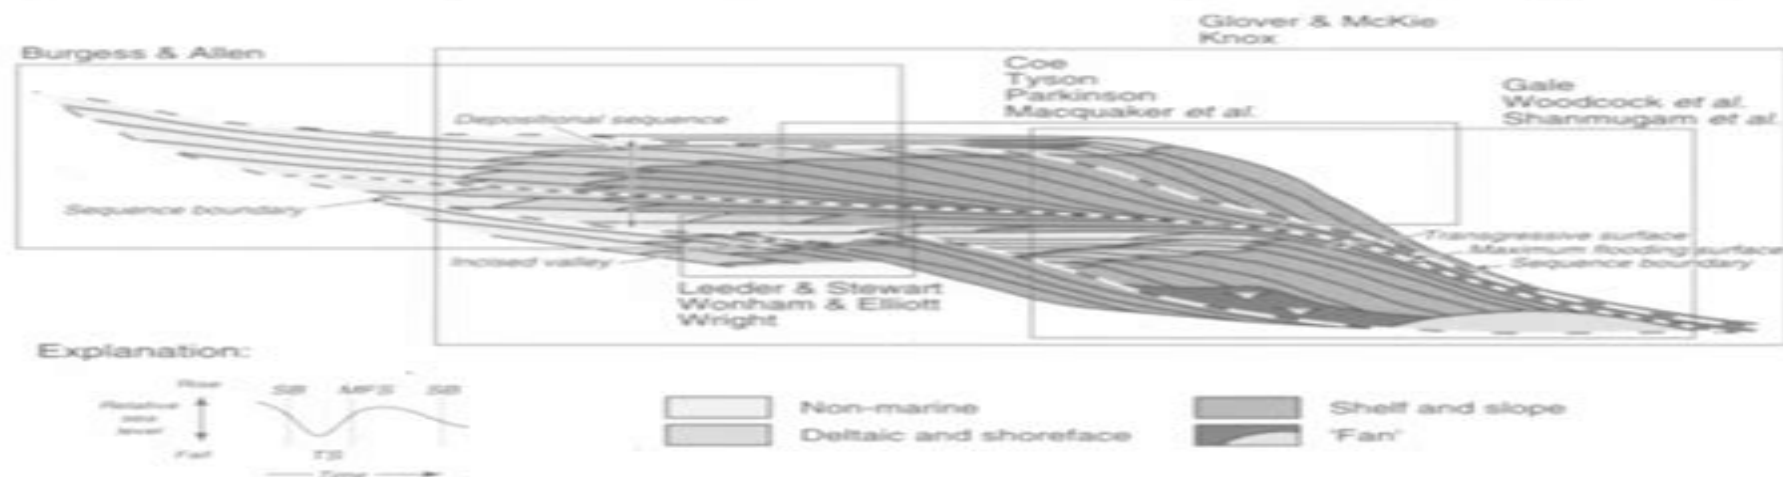

Fig. 1. The standard sequence stratigraphical model for siliciclastic systems (based on Haq *et al.* 1988 and Christie-Blick & Driscoll 1995) showing the different areas covered by papers in this volume. Wright (this volume) and Coe (this volume) discuss successions that were carbonate ramps, with an implied sequence stratigraphical character not dissimilar to siliciclastic deposits (see Schlager 1992; Tucker *et al.* 1993). A *sequence boundary* (SB) is defined as an unconformity and its basinward correlative conformity. The lower of the sequence boundaries in this figure (*type 1*) is distinguished from the upper one (*type 2*) by its association with 'fan' sedimentation at the toe of slope, which has been related to rapid, high-magnitude, relative sea-level fall. The *maximum flooding surface* (MFS) corresponds to the time of greatest landward extent of the facies belts within a depositional sequence, and is characterized by detrital sediment starvation in basinward regions. The *transgressive surface* (TS) is a widespread horizon across which deep-water sediments abruptly overlie shallow water sediments, and it forms as the underlying progradational sedimentary succession is flooded by rising relative sea level. *Systems tracts* are defined between these key surfaces. For full discussion of this model, definition of systems tracts and their relation to relative and eustatic sea-level change the reader should refer to Haq *et al.* (1988), Posamentier & Vail (1988), Posamentier *et al.* (1988, 1990, 1992), Mitchum & Van Wagoner (1991), Vail *et al.* (1991), Jacquini *et al.* (1992) and Posamentier & James (1993). Useful critiques and alternative models are provided by Miall (1986), Galloway (1989), Carter *et al.* (1991), Fulthorpe (1991), Schlager (1991), Walker (1992) and Christie-Blick & Driscoll (1995), and references therein. As a substitute for depositional sequences as defined above, Galloway (1989) has proposed use of *genetic stratigraphic sequences* bounded by maximum flooding surfaces, and his approach has also been followed by many workers.

Sequence stratigraphy of the Jurassic-Lowermost Cretaceous (Hettangian-Berriasian) of the North Sea region

P. Copestake, M.A. Partington, 2023-07-26 Sequence stratigraphy has become a powerful tool in the basin analysis of the North Sea Basin and will continue to play an important role in the maximization of the remaining hydrocarbon potential of the region whilst also supporting the energy transition in carbon capture and storage projects with Jurassic storage units. This Memoir provides a long awaited comprehensive documentation of Jurassic to lowermost Cretaceous sequence stratigraphy of the region UK Norway Denmark and adjacent areas. The volume is amply illustrated by numerous well log displays, core images, seismic lines, chronostratigraphic diagrams and outcrop photographs. Individual chapters discuss the historical usage of sequence stratigraphy in the North Sea, Jurassic sequence stratigraphic concepts and models, application in hydrocarbon field development, definition of stratigraphic traps, well sequence interpretation methodology and controls on sequence development. To complete the volume there are further chapters on North Sea Jurassic lithostratigraphy and its relation to sequence stratigraphy and descriptions of the biozones used to characterize and correlate the sequences. New Perspectives on Deep-water Sandstones G. Shanmugam, 2012-03-14 This handbook is vital for understanding the origin of deep water sandstones, emphasizing sandy mass transport deposits (SMTDs) and bottom current reworked sands (BCRSs) in petroleum reservoirs. This cutting edge perspective, a pragmatic alternative to the conventional turbidite concepts, is crucial because the turbidite paradigm is built on a dubious foundation without empirical data on sandy turbidity currents in modern oceans. In the absence of evidence for sandy turbidity currents in natural environments, elegant theoretical models and experimental observations of turbidity currents are irrelevant substitutes for explaining the origin of sandy deposits as turbidites. In documenting modern and ancient SMTDs, sandy slides, sandy slumps and sandy debrites and BCRSs, deposits of thermohaline contour currents, wind driven currents and tidal currents, the author describes and interprets core and outcrop 1/20 to 1/50 scale from 35 case studies worldwide which include 32 petroleum reservoirs totaling more than 10 000 m in cumulative thickness carried out during the past 36 years (1974-2010). The book dispels myths about the importance of sea level lowstand and provides much needed clarity on the triggering of sediment failures by earthquakes, meteorite impacts, tsunamis and cyclones with implications for the distribution of deep water sandstone petroleum reservoirs. Promotes pragmatic interpretation of deep water sands using alternative possibilities. Validates the economic importance of SMTDs and BCRS in deep water exploration and production. Rich in empirical data and timely new perspectives. *Petroleum Geology of the North Sea* K. W. Glennie, 2009-06-29 Since the 3rd edition of this publication, emphasis within the petroleum industry has shifted from exploration to appraisal and development of existing hydrocarbon resources. This change is reflected in this new 4th edition which has been significantly expanded to accommodate additional material. The centrepiece of the book, however, remains a series of descriptions in stratigraphic order of the depositional history and hydrocarbon related rock units of the
