Developments of the Avian Embryo Freeman, 2012-12-06 In this book we have described the major events of embryonic development and considered the underlying mechanisms which result in the

production of a viable hatchling We have as the subtitle of the book indicates concentrated on behavioural and physiological topics it is not our purpose to consider the early embryology of the bird which is adequately covered by other texts but we have included morphogenetic information where appropriate The form of the book was dictated by a belief that interest in this aspect of development is not confined to embryologists biochemists and physiologists Therefore after describing the conditions in which the egg normally develops we have considered first the whole embryo what it is like at different stages what it does how it gets from one position to another within the shell and how later it comes to interact with the wider environment of the nest Only after this have we considered the development of the nervous and sensory mechanisms on which this transformation depends and on the problem of the level of behavioural maturity with which the chick emerges from the egg With the main lines of development described we have in the second part of the book turned to a detailed consideration of the physiology of development ranging from what may be conveniently described as the life support systems gaseous exchange provision of energy etc to the of hormones in avian development
