both the present volume of *Advances in Nuclear Physics* and in the next volume which will follow in a few months time we
have stretched our normal pattern of reviews by including articles of more major proportions than any we have published
before As a result we have only three review articles in Volume 5 From the beginning of this series it has been our aim as
editors to achieve variation in the scope style and length of individual articles sufficient to match the needs of the individual
topic rather than to restrain authors within rigid limits It has not been our experience that this flexibility has led to
unnecessary exuberance on the part of the authors We feel that the major articles now entering the series are entirely
justified The article by Professor Delves on Variational Techniques in the Nuclear Three Body Problem is an authoritative
definitive article on a subject which forms a cornerstone of nuclear physics If we start with two body interactions then the
three nucleon system is perhaps the only many nucleon system whose exact description may lie within the scope of human
ingenuity In recent years some new techniques of scattering theory originating mostly in particle physics have led to a great
deal of new interest in the nuclear three body problem In this series we have had two articles by Mitra and by Duck on the
new approaches *Library Journal* Melvil Dewey,Richard Rogers Bowker,L. Pylodet,Charles Ammi Cutter,Bertine Emma
