Rudibert King, 2007-08-29 The dramatically increasing requirements of mobility through road rail and airborne transport systems in the future necessitate non evolutionary improvements of transportation systems Without severe implications concerning the environment or restrictions concerning the performance these requirements will only be met by a concerted action of many disciplines It is believed that with ACTIVE FLOW CONTROL a key technology exists to supply an important block in the mosaic to be laid in the pursuit of best and sustainable solutions Manipulation of uid ows is highly advantageous in many cases Aerodynamic or uid ows around or inside bodies impose drag lift and moments on the body remove or supply energy by convection Flow induced noise may be produced by the interaction of a body with the surrounding air Moreover the interaction with the body changes the state of the ow drastically A neatly aligned laminar ow around a wing of an aircraft giving enough lift can become highly irregular and separated from the surface with the result of a loss of lift For cooling of gines of transport and other systems highly irregular turbulent uid ows across the components are needed to guarantee a large heat transfer In future engines of airplanes complying for example with the EU Vision 2020 an increased heat transfer on the other hand has to be avoided by all means in some parts of the engine Turbine stages may be exposed here to extremely hot gases needed for high efficiency which would destroy the blades In this application more laminar ow regimes would be advantageous yielding a poorer heat transfer Their regular ow in a combustor g **Program Solicitation** ,1998
