

Cardiology: A Century of Progress

Eugene Braunwald , MD

Although the vital roles of circulation, and the heart, were defined by William Harvey in the 17th century, and the stethoscope was described by René Laennec in 1816, it was not until the decade from 1895 to 1905 that development of 3 clinically important technologies—sphygmomanometry, electrocardiography, and radiology—led to the birth of cardiology as a medical specialty. This Perspective provides an overview of cardiology in 1924 and how it has changed in the past century. For the former, I leaned heavily on the 10th edition of *Osler's Principles and Practice of Medicine*,¹ which was the leading textbook of medicine at the time, as well as on the medical literature.²

Most physicians in the 1920s were general practitioners with relatively little postgraduate training. Although they measured blood pressure routinely, electrocardiograms and chest X-rays were in the province of the growing number of cardiologists who were internists performing detailed clinical examinations and who used the 3 noninvasive techniques mentioned above. They also measured the vital capacity to detect cardiac or pulmonary disease. Therapy was limited for patients with symptomatic heart disease, for whom Osler recommended “a quiet, regulated, orderly life, free from excitement and worry...an ordinary wholesome diet in moderate quantities...tobacco may be allowed in moderation, but alcohol should be interdicted...”¹ He also recommended that patients with serious heart disease not be informed of this, but that a friend or relative should be. The only cardiac surgery was stripping of adhesive pericarditis. Management was based on “clinical experience” rather than on prospective hypothesis-testing in randomized controlled trials. However, several registries of patients with various cardiac disorders were

begun. Considerable attention was focused on elucidating the causes of chronic cardiac pain, which was troublesome to many patients. These included angina pectoris, thoracic aortic aneurysm, and so-called “cardiac neurosis.”¹

Paul D. White, one of the founders of the American Heart Association, followed his patients carefully and emphasized the importance of ascertaining and recording the natural history of various cardiac disorders. The concept of the prevention of heart disease was introduced, but initially applied only to the development and recurrence of acute rheumatic fever.² A frequent debate concerned indications for tonsillectomy and its possible prevention of acute rheumatic fever. Advances in cardiovascular physiology and pathophysiology were occurring rapidly in the 1920s and were summarized in a widely used book by Carl Wiggers,³ who was a towering figure.

CARDIOVASCULAR DISORDERS IN 1924

Arteriosclerotic cardiovascular disease (ASCVD) was characterized by vascular plaques and thickening of the arterial walls, caused by inflammation and degeneration. It was known to involve the coronary arteries and to cause angina pectoris. Another presentation of ASCVD was acute myocardial infarction, considered to be a grave, albeit infrequent illness, caused by coronary artery thrombosis. At autopsy, arteriosclerotic changes were also found in the aorta and cerebral, renal, and ilio-femoral arteries. Treatment of chronic ASCVD consisted of reductions of weight and blood pressure if elevated; and salt intake. There was no specific treatment for acute myocardial infarction except for bed rest, a liquid diet, and general supportive measures.
