Progress In Parkinsons Disease Research:

Progress in Parkinson's Disease Research--2 Franz Hefti, William J. Weiner, 1992-01-01 There has been a surge of progress made in recent years in Parkinson's research. The cloning of receptors for dopamine has been realized and significant advances have been made in understanding the molecular nature of the interaction between dopamine and mediation of its actions in the brain. In addition, the mechanisms of action of MPTP, a toxin producing parkinsonism in humans and animals, has been further elucidated and is now largely understood. With many contributions on the loss of dopaminergic neurons, the hallmark of Parkinson's disease, *Progress in Parkinson's Disease Research 2* reports on current progress with the hope of accelerating future research efforts in the field. This book brings together top scientists actively engaged in research relevant to Parkinson's disease. *Advances in Parkinson's Disease Research: Exploring Biomarkers and Therapeutic Strategies for Halting Disease Progression* Carmen Venegas, Anastasia Bougea, Yildiz Degirmenci, 2025-08-19 Parkinson's disease (PD) is the fastest growing neurodegenerative disorder, being prevalent in 1% of people aged above 65 years. PD is characterized by the loss of dopaminergic neurons and the accumulation of alpha-synuclein, a rich protein in Lewy bodies. Although aging is the highest risk factor for developing PD, the genetic predisposition and exposure to environmental factors such as herbicides or pesticides can induce oxidative stress, DNA damage, and neuronal death, contributing to PD pathogenesis. To date, there is not a therapy to halt the disease. Many studies have shown multiple altered pathways, offering different approaches for developing an effective therapy; however, the current therapies are merely symptomatic and they include a substitution of dopamine by the administration of Levodopa, the use of catechol O-methyltransferase inhibitors, monoamine oxidase inhibitors, or Dopamine agonists among others. However, these treatments can only relieve some of the symptoms; they do not slow the progression of the disease and they have limited long-term efficacy. *Recent Advances in Parkinson's Disease*, 2010-08-20 This first volume starts with an overview on current perspectives in genetic research and on the molecular mechanisms of neurodegeneration. This is followed by a selection of hot topics in pathophysiological research, from molecular studies to system-level investigations based on in vivo electrophysiological recordings and neurocomputational methods. Complete overview of hot topics and approaches to current PD research, from molecules to brain circuits to clinical and therapeutic applications. Leading authors review the state of the art in their field of investigation and provide their views and perspectives for future research. All chapters include comprehensive background information and are written in a clear form that is accessible also to the non-specialist. **Recent Advances in Parkinson's Disease**, 2020-04-02 *Recent Advances in Parkinson's Disease Research* Volume 252 represents a follow-up on two previous volumes presented in the *Progress in Brain Research* series, Volumes 193 and 193, both published in 2010. It contains a collection of overview articles written by leading researchers in Parkinson's, discussing the most important advances made in basic, translational, and clinical research. Topics of note in this new release include: What can we learn from iPS cell models of PD? What can we learn from

animal models of PD Molecular basis of selective neuronal vulnerability in PD Role of innate and adaptive immunity in Parkinson's disease and much more *Progress in Parkinson Research* Franz Hefti, William J. Weiner, 2011-09-17 In the past five years significant progress has been made in our basic and clinical understanding of Parkinson's disease The discovery that MPTP a relatively simple molecule is able to induce parkinsonism in otherwise healthy adult humans and the recent interest in the possibility of transplantation procedures as a therapeutic modality in the treatment of Parkinson's disease have generated enormous interest in research related to Parkinson's disease In this setting the National Parkinson Foundation decided to organize a research meeting to bring together scientists actively engaged in research relevant to the study of Parkinson's disease to accelerate its progress and to promote an exchange of ideas This meeting took place in January 1988 at Key Biscayne Florida It was decided to publish the proceedings of this meeting to allow rapid documentation of the participants current findings and views regarding this rapidly evolving field The structure of this volume follows the organization of the meeting and begins with a clinical and neuropathological review of current knowledge regarding Parkinson's disease Since dopaminergic neurons play a major role in the pathophysiology of the disease many of the contributions relate to some aspects of dopaminergic function including localization regulation and pharmacology of dopamine receptors A special effort has been made to provide a summary of the present knowledge of the cellular biology of the dopaminergic neurons *Departments of Labor, Health and Human Services, and Education, and Related Agencies Appropriations for Fiscal Year 2000* United States.
