Project Management in Manufacturing and High Technology Operations Adedeji Bodunde Badiru, 1996-06-07 Project management is a system originally developed within the construction industry for controlling schedules costs and specifications of large multitask projects In recent years manufacturers have discovered that project management s time tested techniques dovetail neatly with the current thinking on quality control and management in a highly competitive global marketplace The system has been increasingly recognized for its suitability in the manufacturing process and is now applied in virtually every area of production One of the foremost proponents of this trend is Adedeji Badiru an internationally recognized authority on project management whose books have helped thousands of companies adapt the system to their particular needs This completely revised Second Edition of Badiru s breakthrough publication *Project Management in Manufacturing and High Technology Operations* focuses on the dramatic increase in the use of high tech machinery in industrial operations and seamlessly integrates high tech themes into a general discussion of project management An introductory chapter on manufacturing analysis investigates how the latest concepts and techniques of project management are applied to manufacturing The main body of the book offers a wealth of new material including discussions of learning curve analysis basic models for forecasting and inventory control economic analysis of manufacturing techniques for data analysis and the application of expert systems The chapter on computer applications in project management is completely revised and updated to reflect the enormous strides taken in this area in recent years This book presents an up to date practical approach to project management in manufacturing Written by a pioneer in the application of project management to the manufacturing industries this revised and expanded Second Edition of *Project Management in Manufacturing and High Technology Operations* reflects the increased use of high tech machinery in industrial operations and the trends of recent years to apply project management methods to every phase of production Complete with numerous illustrations as well as exercises to wrap up each chapter this Second Edition features An emphasis on practical examples including many new case studies and a full chapter on the lessons learned from the space shuttle Challenger disaster Many new project management concepts and techniques that focus on manufacturing but can be applied to any project A new chapter on manufacturing systems analysis that provides the backdrop for the project analysis that takes place throughout the book Expanded discussions of the latest quantitative and managerial approaches including learning curve analysis basic models for forecasting and inventory control economic analysis of manufacturing techniques for data analysis and the application of expert systems A strong international perspective useful for multinational companies and for academic purposes This book equips engineers and managers with the tools to effectively manage all aspects of a project including quality control schedules and expenses Used as a text in engineering or business courses it offers absorbing supplemental reading for students at the upper undergraduate and graduate levels Professor Badiru has been widely praised for his incisive and highly

relevant case studies In this Second Edition the case study approach is expanded so that chapters typically include two real world examples of the project management techniques or issues in question In the final chapter Badiru takes a close and painful look at a high tech disaster the explosion of the space shuttle Challenger He offers rare and instructive insight into the devastating failure of a high tech project still poignant despite the passage of time Communicative throughout this volume provides a solid up to date reference for engineers and managers in manufacturing as well as for consultants and administrators in related fields Professor Badiru s proven reputation for providing interesting lecture material also makes **Project Management in Manufacturing and High Technology Operations** especially useful as a technology management text in both engineering and business schools Cover Design Illustration David Levy

Project Management for Research A.B. Badiru, 2012-12-06 Graduate research is a complicated process which many engineering and science students aspire to undertake The complexity of the process can lead to failures for even the

most brilliant students Success with graduate level research requires not only a high level of intellectual ability but also a high level of program management skills After many years of supervising several graduate students I have found that most of them have the same basic problems of planning and implementing their research programs Even the advanced graduate students need the same mentoring and management guidance that has little to do with actual classroom performance It is my conjecture that graduate students could make a better job of their research programs if a self paced guide were available to them The guide provided in this book covers topics ranging from how to select an appropriate research problem to how to schedule and execute research tasks The book takes a project management approach to planning and implementing graduate research in engineering science and manufacturing disciplines It is a self paced guide that will help graduate students and advisors answer most of the basic questions about how to do this and how to do that There is a need for such a guide book The book will alleviate frustration on the part of the student and the research advisor

Economics of Advanced Manufacturing Systems Hamid R. Parsaei, A. Mital, 2012-12-06 The 1980s have witnessed a tremendous growth in the field of computer integrated manufacturing systems

The other major areas of development have been computer aided design computer aided manufacturing industrial robotics automated assembly cellular and modular material handling computer networking and office automation to name just a few. These new technologies are generally capital intensive and do not conform to traditional cost structures. The net result is a tremendous change in the way costs should be estimated and economic analyses performed. The majority of existing engineering economy texts still profess application of traditional analysis methods. But as was mentioned above it is clear that the basic trend in manufacturing industries is itself changing. So it is quite obvious that the practice of traditional economic analysis methods should change too. This book is an attempt to address the various issues associated with non traditional methods for evaluation of advanced computer integrated technologies. This volume consists of twenty refereed articles which are grouped into five parts. Part one Economic Justification Methods consists of six articles. In the first paper Soni et al. present a new classification for economic justification methods for advanced automated manufacturing systems. In the second Henghold and LeClair look at strengths and weaknesses of expert systems in general and more specifically an application aimed at investment justification in advanced technology. The third paper by Carrasco and Lee proposes an enhanced economic methodology to improve the needs analysis conceptual design and detailed design activities associated with technology modernization.
