Study Design

Light as a wave

- describe light as an electromagnetic wave which is produced by the acceleration of charges, which in turn produces changing electric fields and associated changing magnetic fields
- identify that all electromagnetic waves travel at the same speed, c , in a vacuum
- compare the wavelength and frequencies of different regions of the electromagnetic spectrum, including radio, microwave, infrared, visible, ultraviolet, x-ray and gamma, and identify the distinct uses each has in society
- investigate and analyse theoretically and practically the behaviour of waves including:
 - refraction using Snell's Law: $n_1 \sin(\theta_1) = n_2 \sin(\theta_2)$ and $n_1 v_1 = n_2 v_2$
 - total internal reflection and critical angle including applications: $n_1 \sin(\theta_c) = n_2 \sin(90^\circ)$
- investigate and explain theoretically and practically colour dispersion in prisms and lenses with reference to refraction of the components of white light as they pass from one medium to another

Production of light from matter

- compare the production of light in lasers, synchrotrons, LEDs and incandescent lights.

Light is the only thing that we can see. But what is light? Maxwell developed an answer to question of what is the nature of light, when he discovered that light was an electromagnetic radiation within the frequency range of 4.3×10^{14} to 7×10^{14} Hz. These waves activate the "electrical antennae" in the retina of the eye. He understood that light of any kind is energy carrying waves of electric and magnetic fields that continually regenerate each other and travel at a single fixed speed, the speed of light.

An accelerating charge creates a changing current. Every current is surrounded by a magnetic field, so every changing current is surrounded by a changing magnetic field. We also know that every changing magnetic field will induce an EMF, in other words, generates an electric field. This is electromagnetic induction.

If the magnetic field is oscillating, the electric field that it generates will be oscillating, too. This oscillating electric field induces an oscillating magnetic field. The vibrating electric and magnetic fields regenerate each other to make up an **electromagnetic wave**, which emanates from the vibrating charge.

In summary, light is an energy- carrying electromagnetic wave that emanates from vibrating electrons in atoms.
