Abstract: The purpose of this study was to determine the effect of a 12-week training program on the physical fitness and health of sedentary middle-aged men. The study was conducted in a laboratory setting. The subjects were 20 sedentary middle-aged men (mean age 45.5 years, range 40-55 years). They were divided into two groups: a control group (n = 10) and an exercise group (n = 10). The exercise group performed a 12-week training program consisting of three sessions per week, each lasting 30 minutes. The training program included aerobic exercise, strength training, and flexibility exercises. The control group did not participate in any training program. The physical fitness and health of the subjects were measured at the beginning and end of the 12-week period. The measurements included heart rate, blood pressure, body mass index (BMI), and body fat percentage. The results of the study showed that the exercise group had significantly lower heart rate, blood pressure, BMI, and body fat percentage at the end of the 12-week period compared to the control group. These findings suggest that a 12-week training program can improve the physical fitness and health of sedentary middle-aged men.
