Propagation Of A Curved Shock And Nonlinear Ray Theory:

Propagation of a Curved Shock and Nonlinear Ray Theory Prasad,1993-09-27 Phoolan Prasad's book contains theoretical developments in the study of the propagation of a curved nonlinear wave front and shock front particularly in the caustic region. It should be an invaluable reference source for researchers in nonlinear waves, fluid dynamics, especially gas dynamics, mathematical physics, aeronautical, chemical, and mechanical engineering.

Propagation of Multidimensional Nonlinear Waves and Kinematical Conservation Laws Phoolan Prasad,2018-03-06 This book formulates the kinematical conservation laws. KCL analyses them and presents their applications to various problems in physics. Finally, it addresses one of the most challenging problems in fluid dynamics: finding successive positions of a curved shock front. The topics discussed are the outcome of collaborative work that was carried out mainly at the Indian Institute of Science, Bengaluru, India. The theory presented in the book is supported by referring to extensive numerical results. The book is organised into ten chapters. Chapters 1-4 offer a summary of and briefly discuss the theory of hyperbolic partial differential equations and conservation laws. Formulation of equations of a weakly nonlinear wavefront and those of a shock front are briefly explained in Chapter 5, while Chapter 6 addresses KCL theory in space of arbitrary dimensions. The remaining chapters examine various analyses and applications of KCL equations ending in the ultimate goal: propagation of a three-dimensional curved shock front and formation, propagation, and interaction of kink lines on it.

Nonlinear Hyperbolic Waves in Multidimensions Phoolan Prasad,2001-05-18 The propagation of curved nonlinear wavefronts and shock fronts are very complex phenomena. Since the 1993 publication of his work *Propagation of a Curved Shock and Nonlinear Ray Theory*, author Phoolan Prasad and his research group have made significant advances in the underlying theory of these phenomena. This volume presents their results and progress.

Dynamics of Nonlinear Waves in Dissipative Systems: Reduction, Bifurcation and Stability G Dangelmayr, K Kirchgassner, B Fiedler, Alexander Mielke,1996-08-01 The mathematical description of complex spatiotemporal behaviour observed in dissipative continuous systems is a major challenge for modern research in applied mathematics. While the behaviour of low-dimensional systems governed by the dynamics of a finite number of modes is well understood, systems with large or unbounded spatial domains show intrinsic infinite-dimensional behaviour not a priori accessible to the methods of finite-dimensional dynamical systems. The purpose of the four contributions in this book is to present some recent and active lines of research in evolution equations posed in large or unbounded domains. One of the most prominent features of these systems is the propagation of various types of patterns in the form of waves such as travelling and standing waves and pulses and fronts. Different approaches to studying these kinds of phenomena are discussed in the book. A major theme is the reduction of an original evolution equation in the form of a partial differential equation system to a simpler system of equations, either a system of ordinary differential equations or a canonical system of PDEs. The study of the reduced equations provides insight into the bifurcations from simple to more complicated solutions and their stabilities.

Nonlinear

Dynamics and Pattern Formation in the Natural Environment A Doelman,A Van Harten,2022-09-16 This Research Note aims to provide an insight into recent developments in the theory of pattern formation In the last decade there has been considerable progress in this field both from a theoretical and a practical point of view Recent mathematical developments concern the study of the nonlinear stability of systems at near critical conditions by an appropriate system of modulation equations The complexity of the original problem can be reduced drastically by this approximation Moreover it provides unifying point of view for a wide range of problems New applications of the theory arise in a multitude of scientific areas such as hydrodynamics reaction diffusion problems oceanography meteorology combustion geophysical and biological morphodynamics and semi conductors This book is intended to show the interactions between the mathematical theory of nonlinear dynamics and the study of pattern generating phenomena in the natural environment There is an intimate relationship between new insights in the mathematical aspects of nonlinear pattern formation and the comprehension of such phenomena Therefore there are two partly overlapping main themes one in which the emphasis is on generally applicable mathematical theories and techniques and one in which the phenomenology of pattern evolution in various areas is discussed The book comprises 19 contributions by experts in the field Although the emphasis changes considerably from paper to paper in each contribution the same two themes are present all the authors have aimed to achieve a suitable balance between the mathematical theory and the physical phenomena

Nonlinear Variational Problems and Partial Differential Equations A Marino,M K V Murthy,1995-02-27 Contains proceedings of a conference held in Italy in late 1990 dedicated to discussing problems and recent progress in different aspects of nonlinear analysis such as critical point theory global analysis nonlinear evolution equations hyperbolic problems conservation laws fluid mechanics gamma convergence homogenization and relaxation methods Hamilton Jacobi equations and nonlinear elliptic and parabolic systems Also discussed are applications to some questions in differential geometry and nonlinear partial differential equations

General Theory of Partial Differential Equations and Microlocal Analysis Min-You Qi,L Rodino,1996-05-20

Conjugate Gradient Type Methods for Ill-Posed Problems Martin Hanke,2017-11-22 The conjugate gradient method is a powerful tool for the iterative solution of self adjoint operator equations in Hilbert space This volume summarizes and extends the developments of the past decade concerning the applicability of the conjugate gradient method and some of its variants to ill posed problems and their regularization Such problems occur in applications from almost all natural and technical sciences including astronomical and geophysical imaging signal analysis computerized tomography inverse heat transfer problems and many more This Research Note presents a unifying analysis of an entire family of conjugate gradient type methods Most of the results are as yet unpublished or obscured in the Russian literature Beginning with the original results by Nemirovskii and others for minimal residual type methods equally sharp convergence results are then derived with a different technique for the classical Hestenes Stiefel algorithm In the final chapter some of these results are extended to

selfadjoint indefinite operator equations The main tool for the analysis is the connection of conjugate gradient type methods to real orthogonal polynomials and elementary properties of these polynomials These prerequisites are provided in a first chapter Applications to image reconstruction and inverse heat transfer problems are pointed out and exemplarily numerical results are shown for these applications

Topological Circle Planes and Topological Quadrangles Andreas E Schroth, 1995-11-03 This research note presents a complete treatment of the connection between topological circle planes and topological generalized quadrangles The author uses this connection to provide a better understanding of the relationships between different types of circle planes and to solve a topological version of the problem of Apollonius Topological Circle Planes and Topological Quadrangles begins with a foundation in classical circle planes and the real symmetric generalized quadrangle and the connection between them This provides a solid base from which the author offers a more generalized exploration of the topological case He also compares this treatment to the finite case Subsequent chapters examine Laguerre M bius and Minkowski planes and their respective relationships to antiregular quadrangles The author addresses the Lie geometry of each and discuss the relationships of circle planes the sisters of M bius Laguerre and Minkowski planes and concludes by solving a topological version of the problem of Apollonius in Laguerre M bius and Minkowski planes The treatment offered in this volume offers complete coverage of the topic The first part of the text is accessible to anyone with a background in analytic geometry while the second part requires basic knowledge in general and algebraic topology Researchers interested in geometry particularly in topological geometry will find this volume intriguing and informative Most of the results presented are new and can be applied to various problems in the field of topological circle planes Features

Multifractal theory was introduced by theoretical physicists in 1986. Since then, multifractals have increasingly been studied by mathematicians. This new work presents the latest research on random results on random multifractals and the physical thermodynamical interpretation of these results. As the amount of work in this area increases, Lars Olsen presents a unifying approach to current multifractal theory. Featuring high quality original research material, this important new book fills a gap in the current literature available, providing a rigorous mathematical treatment of multifractal measures.
