Catastrophic Thinking David Sepkoski, 2020-09-24 A history of scientific ideas about extinction that explains why we learned to value diversity as a precious resource at the same time as we learned to think catastrophically about extinction We live in an age in which we are repeatedly reminded by scientists by the media by popular culture of the looming threat of mass extinction We're told that human activity is currently producing a sixth mass extinction perhaps of even greater magnitude than the five previous geological catastrophes that drastically altered life on Earth Indeed there is a very real concern that the human species may itself be poised to go the way of the dinosaurs victims of the most recent mass extinction some 65 million years ago How we interpret the causes and consequences of extinction and their ensuing moral imperatives is deeply embedded in the cultural values of any given historical moment And as David Sepkoski reveals the history of scientific ideas about extinction over the past two hundred years as both a past and a current process is implicated in major changes in the way Western society has approached biological and cultural diversity It seems self-evident to most of us that diverse ecosystems and societies are intrinsically valuable but the current fascination with diversity is a relatively recent phenomenon In fact the way we value diversity depends crucially on our sense that it is precarious that it is something actively threatened and that its loss could have profound consequences In *Catastrophic Thinking* Sepkoski uncovers how and why we learned to value diversity as a precious resource at the same time as we learned to think catastrophically about extinction

Ecocide Franz Brosch, 2002-09-20 We live in an age of ecocide Changes of enormous ecological significance are occurring on our planet the ozone layer is beginning to disintegrate Since 1970 the world's forests have almost halved A quarter of the world's fish have been depleted 70% of biologists believe the world is now in the midst of the fastest mass extinction of species in the planet's 4.5 billion year history Biodiversity loss is rated as a more serious environmental problem than the depletion of the ozone layer global warming or pollution and contamination How have we come to this and what can be done to conserve our environment for the future *Ecocide* examines the facts behind the figures to offer a disturbing account of the ecological impact that the human species has on the planet It shows how we are wilfully destroying our world Highlighting important countermovements who are working for ecological democracy this unique book is essential for anyone who cares about conserving our environment for the future

Head, 2004 This volume explores geological boundaries in time and space using palynology and micropalaeontology Boundaries produce distinct signatures in the micropalaeontological record They can tell us much about the response of biotic systems to environmental change in both marine and terrestrial realms Different microfossil groups and geological contexts require their own approaches definitions and considerations of boundaries The papers here cover the methodology of boundary identification from biostratigraphical ecological and palaeoenvironmental perspectives

Biological Diversity L. N. Petrov,2003 One of the cornerstones of life s wonders is the vast array of species filling the planet From plants to animals to humans there is no shortage of beings to provide spice of life variety is said to be Periodically scientists announce the discovery of a new form of life so it seems as if Earth is capable of producing new species just to keep us on our toes At times the immense breadth of living things can even feel overwhelming as one pauses to ponder how numerically insignificant humans are when compared to the insect population Given the biological diversity of the planet it is incumbent upon humans to safeguard the natural beauty of the environment To that end conservation takes on special importance necessitating the balancing of industrial expansion with preserving the flora and fauna surrounding us This book is an important tool in understanding and researching the many different life forms spanning the globe Collected here is a substantial and carefully selected listing of relevant literature on biological diversity and its conservation Following this bibliography are author title and subject indexes to allow for further access to this information The sheer bulk of the works about biological diversity can be so intimidating that a book such as this one becomes useful in sorting through the resources about the importance of life s variety

Endangerment, Biodiversity and Culture Fernando Vidal, Nélia Dias, 2015-06-19 The notion of Endangerment stands at the heart of a network of concepts values and practices dealing with objects and beings considered threatened by extinction and with the procedures aimed at preserving them Usually animated by a sense of urgency and citizenship identifying endangered entities involves evaluating an impending threat and opens the way for preservation strategies Endangerment Biodiversity and Culture looks at some of the fundamental ways in which this process involves science but also more than science not only data and knowledge and institutions but also affects and values Focusing on an endangerment sensibility it encapsulates tensions between the normative and the utilitarian the natural and the cultural The chapters situate that specifically modern sensibility in historical perspective and examine central aspects of its recent and present forms This timely volume offers the most cutting edge insights into the Environmental Humanities for researchers working in Environmental Studies History Anthropology Sociology and Science and Technology Studies
