

SENSORY RECEPTORS

- A **receptor**
 - is a cell, often a specialized neuron,
 - suited by its structure and function to respond to a particular form of energy, such as sound.
 - Function: Convert that energy into a neural response.
- **Adequate stimulus:** energy form for which receptor is specialized to detect
 - Due to the imperfect specialization of receptors, other stimuli will often produce responses as well.
 - For example, if you apply pressure to the side of your eyeball (through the lid) you will see a circular dark spot.

Stein,2012-06-01 The major reference work for a rapidly advancing field synthesizes central themes reports on current findings and offers a blueprint for future research Scientists attempts to understand the physiology underlying our

apprehension of the physical world was long dominated by a focus on the individual senses The 1980s saw the beginning of systematic efforts to examine interactions among different sensory modalities at the level of the single neuron And by the end of the 1990s a recognizable and multidisciplinary field of multisensory processes had emerged More recently studies involving both human and nonhuman subjects have focused on relationships among multisensory neuronal ensembles and their behavioral perceptual and cognitive correlates The New Handbook of Multisensory Processing synthesizes the central themes in this rapidly developing area reports on current findings and offers a blueprint for future research The contributions all of them written for this volume by leading experts reflect the evolution and current state of the field This handbook does more than simply review the field Each of the volume s eleven sections broadly surveys a major topic and each begins with a substantive and thought provoking commentary by the section editor that identifies the major issues being explored describes their treatment in the chapters that follow and sets these findings within the context of the existing body of knowledge Together the commentaries and chapters provide an invaluable guide to areas of general agreement unresolved issues and topics that remain to be explored in this fast moving field The Neural Bases of Multisensory Processes Micah M. Murray, Mark T. Wallace, 2011-08-25 It has become accepted in the neuroscience community that perception and performance are quintessentially multisensory by nature Using the full palette of modern brain imaging and neuroscience methods The Neural Bases of Multisensory Processes details current understanding in the neural bases for these phenomena as studied across species stages *Fish Cognition and Behavior* Culum Brown, Kevin Laland, Jens Krause, 2008-04-15 The study of animal cognition has been largely confined to birds and mammals a historical bias which has led to the belief that learning plays little or no part in the development of behaviour in fishes and reptiles Research in recent decades has begun to redress this misconception and it is now recognised that fishes exhibit a rich array of sophisticated behaviour with impressive learning capabilities entirely comparable with those of mammals and other terrestrial animals In this fascinating book an international team of experts have been brought together to explore all major areas of fish learning including foraging skills Predator recognition Social organisation and learning Welfare and pain Fish Cognition and Behavior is an important contribution to all fish biologists and ethologists and contains much information of commercial importance for fisheries managers and aquaculture personnel Libraries in universities and research establishments will find it an important addition to their shelves *Specialization, Speciation, and Radiation* Kelley Tilmon, 2008-01-03 The intimate associations between plants and the insects that eat them have helped define and shape both groups for millions of years This pioneering volume is a comprehensive up to date treatment of the evolutionary biology of herbivorous insects including their relationships with host plants and natural enemies Chapters focus on the dynamic relationships between insects and plants from the standpoint of evolutionary change at different levels of biological organization individuals populations species and clades Written by prominent evolutionary biologists entomologists and ecologists the chapters are organized into three

sections Evolution of Populations and Species Co and Macroevolutionary Radiation and Evolutionary Aspects of Pests Invasive Species and the Environment The volume is unified by the idea that understanding the ecological framework of the interactions between herbivorous insects and their host plants is fundamental to understanding their evolution

addressing all aspects of how the nervous system and its components develop Particular attention is paid to the effects of abnormal development and on new psychiatric neurological treatments being developed based on our increased understanding of developmental mechanisms Each volume in the series consists of review style articles that average 15 20pp and feature numerous illustrations and full references Volume 3 offers 40 high level articles devoted mainly to anatomical and functional development of neural circuits and neural systems as well as those that address neurodevelopmental disorders in humans and experimental organisms Series offers 144 articles for 2904 full color pages addressing ways in which the nervous system and its components develop Features leading experts in various subfields as Section Editors and article Authors All articles peer reviewed by Section Editors to ensure accuracy thoroughness and scholarship Volume 3 sections include coverage of mechanisms that control the assembly of neural circuits in specific regions of the nervous system multiple aspects of cognitive development and disorders of the nervous system arising through defects in neural development

Morphic Resonance Rupert Sheldrake, 2009-09-09 New updated and expanded edition of the groundbreaking book that ignited a firestorm in the scientific world with its radical approach to evolution Explains how past forms and behaviors of organisms determine those of similar organisms in the present through morphic resonance Reveals the nonmaterial connections that allow direct communication across time and space When *A New Science of Life* was first published the British journal *Nature* called it the best candidate for burning there has been for many years The book called into question the prevailing mechanistic theory of life when its author Rupert Sheldrake a former research fellow of the Royal Society proposed that morphogenetic fields are responsible for the characteristic form and organization of systems in biology chemistry and physics and that they have measurable physical effects Using his theory of morphic resonance Sheldrake was able to reinterpret the regularities of nature as being more like habits than immutable laws offering a new understanding of life and consciousness In the years since its first publication Sheldrake has continued his research to demonstrate that the past forms and behavior of organisms influence present organisms through direct immaterial connections across time and space This can explain why new chemicals become easier to crystallize all over the world the more often their crystals have already formed and why when laboratory rats have learned how to navigate a maze in one place rats elsewhere appear to learn it more easily With more than two decades of new research and data Rupert Sheldrake makes an even stronger case for the validity of the theory of formative causation that can radically transform how we see our world and our future
