Utilization of Refuse Derived Fuels by the United States Navy D. L. Lehr, COLORADO UNIV AT

BOULDER DEPT OF CIVIL ENGINEERING., 1983 The Resource Conservation and Recovery Act and the Safe Drinking Water Act are forcing those in charge of landfills to adhere to more stringent operating standards This along with the growing scarcity of landfill availability makes the use of landfills less desirable for solid waste disposal As such new disposal methods that are environmentally safe and economically practical must be found One alternative that is not really new but which has gained renewed interest is incineration The Resource Conservation and Recovery Act also requires that government agencies should direct their installations to recover as many resources as possible Therefore if incineration is to be implemented heat recovery should be incorporated into the system There are several processes available to convert raw refuse into a fuel for use in a heat recovery system Refuse derived fuels RDF can be in the form of raw refuse densified refuse powdered refuse gas or pyrolytic oil The only form of RDF that is economically feasible for systems designed to process less than 200 TPD tons per day is raw refuse Most Navy bases generate far less than 200 TPD of solid waste and therefore the Navy has focused most of its attention on modular heat recovery incinerator HRI systems that utilize raw refuse as fuel

Technologies for Converting Biomass to Useful Energy Erik

Dahlquist, 2013-04-16 Officially the use of biomass for energy meets only 10 13% of the total global energy demand of 140

000 TWh per year Still thirty years ago the official figure was zero as only traded biomass was included While the actual production of biomass is in the range of 270 000 TWh per year most of this is not used for energy purposes and mostly it is not used very efficiently Therefore there is a need for new methods for converting biomass into refined products like chemicals fuels wood and paper products heat cooling and electric power Obviously some biomass is also used as food our primary life necessity The different types of conversion methods covered in this volume are biogas production bio ethanol production torrefaction pyrolysis high temperature gasification and combustion This book covers the suitability of different methods for conversion of different types of biomass Different versions of the conversion methods are presented both existing methods and those being developed for the future System optimization using modeling methods and simulation are analyzed to determine advantages and disadvantages of different solutions Many international experts have contributed to provide an up to date view of the situation all over the world These global perspectives and the inclusion of so much expertise of distinguished international researchers and professionals make this book unique This book will prove useful and inspiring to professionals engineers researchers and students as well as to those working for different authorities and organizations
