High-Resolution Imaging and Spectrometry of Materials Frank Ernst, Manfred

Rühle, 2013-03-09 The characterisation of materials and material systems is an essential aspect of materials science A few decades ago it became obvious that because the properties of materials depend so critically on the microstructure of their components this characterisation must be determined to the atomic level This means that the position as well as the nature of individual atoms has to be determined at critical regions close to defects such as dislocations interfaces and surfaces The great impact of advanced transmission electron microscopy TEM techniques became apparent in the area of semiconducting materials where the nature of internal interfaces between silicon and the corresponding silicides could be identified and the results used to enhance the understanding of the properties of the compounds studied At that time advanced TEM techniques existed predominantly in the US However advanced TEM instrumentation was not available in the materials science and solid state science communities in Germany This gap was bridged by the late Peter Haasen who after a visit to the US initiated a Priority Programme on Microstructural Characterisation at the Volkswagen Foundation Hannover The programme was in effect from 1985 to 1997 and supported a wide range of research projects from fundamental trendy innovative projects to projects in applied materials science

Surface Reactions R.J. Madix, 2012-12-06 In the past ten years the study of the mechanisms of chemical transformations on metal surfaces has advanced appreciably Today complex reaction networks can be unraveled by combining several spectroscopies derived principally from the practice of ultrahigh vacuum surface physics Of paramount importance in this field is the combination of mass spectrometric methods for the identification of reaction products with spectroscopies which help identify surface bound reactive intermediates This quasi monograph highlights the progress in this field with studies which clearly exemplify such research and at the same time provide more general understanding of chemical reactivity at surfaces This book was constructed to be a resource to all scientists interested in the chemical reactivity of metals including those whose primary interest may lie in fields outside surface reactivity The book is intended to be an advanced case study text not a review in the standard sense Each chapter develops principles and illustrates the use of experimental methods Consequently more attention is given to experimentation than normally found in journal articles or review articles My intent in organizing these chapters was to make this field accessible to professionals and graduate students in the fields of chemistry material science and physics Even so we hope that experts in the field of surface reactivity will also find these chapters informative After the introduction Chap 1 the book consists of chapters on the mechanism of selective oxidation by silver Chap 2 by R J Madix and J T
