Scheduling Algorithms 4th Edition:

Scheduling Algorithms Peter Brucker, 2004-02-23 Besides scheduling problems for single and parallel machines and shop scheduling problems the book covers advanced models involving due dates sequence dependent changeover times and batching Also multiprocessor task scheduling and problems with multipurpose machines are discussed The method used to solve these problems are linear programming dynamic programming branch and bound algorithms and local search heuristics Complexity results for the different classes of deterministic scheduling problems are updated and summarized Also the references are updated *Handbook on Scheduling* Jacek Blazewicz, Klaus H. Ecker, Erwin Pesch, Günter

Schmidt, Malgorzata Sterna, Jan Weglarz, 2019-04-25 This handbook provides a comprehensive introduction to the theory and applications of scheduling in advanced planning and computer systems It addresses a broad audience including practitioners and researchers interested in scheduling as well as graduate and advanced undergraduate students in the fields of computer science and computer engineering operations research industrial and real time engineering management science business administration and information systems and applied mathematics The book begins by providing an introduction to and basic concepts from discrete mathematics Single and multiple processor systems are covered with a focus on multiprocessor tasks and hard real time systems Flow shop and open shop scheduling as well as scheduling in job shops are explained in detail Issues like limited processor availability time dependence resource constraints and imprecise computations are dealt with in dedicated chapters Special attention is given to online scheduling constraint programming and disjunctive scheduling The book also features applications and cases involving flexible manufacturing systems computer integrated production scheduling and logistics In particular it presents case studies on optimization procedures for the production of acrylic glass and of helicopter parts in a flexible manufacturing system an efficient decision support system for airport gate scheduling concrete delivery planning and berth and quay crane allocation at seaports **Complex Scheduling** Peter Brucker, Sigrid

Knust, 2006-04-26 Scheduling problems have been investigated since the late fties Two types of applications have mainly motivated research in this area project planning and machine scheduling While in machine scheduling a large number of specific scheduling situations depending on the machine environment and the job characteristics have been considered the early work in project planning investigated scheduling situations with precedence constraints between activities assuming that sufficient resources are available to perform the activities More recently in project scheduling scarce resources have been taken into account leading to so called resource constrained project scheduling problems On the other hand also in machine scheduling more general and complex problems have been investigated Due to these developments today both areas are much closer to each other Furthermore applications like timetabling rostering or industrial scheduling are connected to both areas This book deals with such complex scheduling problems and methods to solve them It consists of three parts The first part Chapters 1 and 2 contains a description of basic scheduling models with applications and an introduction into discrete

optimization covering complexity shortest path algorithms linear programming network flow algorithms and general optimization methods In the second part Chapter 3 resource constrained project scheduling problems are considered Especially methods like constraint propagation branch and bound algorithms and heuristic procedures are described Furthermore lower bounds and general objective functions are discussed

Task Scheduling for Parallel Systems Oliver Sinnen,2007-05-04 A new model for task scheduling that dramatically improves the efficiency of parallel systems Task scheduling for parallel systems can become a quagmire of heuristics models and methods that have been developed over the past decades The author of this innovative text cuts through the confusion and complexity by presenting a consistent and comprehensive theoretical framework along with realistic parallel system models These new models based on an investigation of the concepts and principles underlying task scheduling take into account heterogeneity contention for communication resources and the involvement of the processor in communications For readers who may be new to task scheduling the first chapters are essential They serve as an excellent introduction to programming parallel systems and they place task scheduling within the context of the program parallelization process The author then reviews the basics of graph theory discussing the major graph models used to represent parallel programs Next the author introduces his task scheduling framework He carefully explains the theoretical background of this framework and provides several examples to enable readers to fully understand how it greatly simplifies and at the same time enhances the ability to schedule The second half of the text examines both basic and advanced scheduling techniques offering readers a thorough understanding of the principles underlying scheduling algorithms The final two chapters address communication contention in scheduling and processor involvement in

communications Each chapter features exercises that help readers put their new skills into practice An extensive bibliography leads to additional information for further research Finally the use of figures and examples helps readers better visualize and understand complex concepts and processes Researchers and students in distributed and parallel computer systems will find that this text dramatically improves their ability to schedule tasks accurately and efficiently
