human manipulation Understanding and modeling these capabilities represents an important topic not only for neuroscience but also for robotics in a mutual inspiration both to inform the design and control of artificial systems and at the same time to increase knowledge on the biological side Within this context synergies i e goal directed actions that constrain multi DOFs of the human body and can be defined at the kinematic muscular neural level have gained increasing attention as a general simplified approach to shape the development of simple and effective artificial devices The execution of such purposeful sensory motor primitives on the biological side leverages on the interplay of the sensory motor control at central and peripheral level and the interaction of the human body with the external world This interaction is particularly important considering the new concept of robotic soft manipulation i e soft adaptable yet robust robotic hands that can deform with the external environment to multiply their grasping and manipulation capabilities Under this regard a preeminent role is reserved to touch being that skin is our primary organ to shape our knowledge of the external world and hence to modify it in interaction with the efferent parts This Research Topic reports results on the mutual inspiration between neuroscience and robotics and on how it is possible to translate neuroscientific findings on human manipulation into engineering guidelines for simplified systems able to take full advantage from the interaction and hence exploitation of environmental constraints for task accomplishment and knowledge acquisition

Motor Cortex Microcircuits (Frontiers in Brain Microcircuits Series) Michael Brecht,Nicholas Hatsopoulos,Takehsi Kaneko,Gordon M. G Shepherd,2015-01-05 How does the motor cortex enable mammals to generate accurate complex and purposeful movements A cubic millimeter of motor cortex contains roughly 10 5 cells an amazing 4 Km of axons and 0 4 Km of dendrites somehow wired together with 10 9 synapses Corticospinal neurons a k a Betz cells upper motor neurons are a key cell type monosynaptically conveying the output of the cortical circuit to the spinal cord circuits and lower motor neurons But corticospinal neurons are greatly outnumbered by all the other kinds of neurons in motor cortex which presumably also contribute crucially to the computational operations carried out for planning executing and guiding actions Determining the wiring patterns the dynamics of signaling and how these relate to movement at the level of specific excitatory and inhibitory cell types is critically important for a mechanistic understanding of the input output organization of motor cortex While there is a predictive microcircuit hypothesis that relates motor learning to the operation of the cerebellar cortex we lack such a microcircuit understanding in motor cortex and we consider microcircuits as a central research topic in the field This Research Topic covers any issues relating to the microcircuit level analysis of motor cortex Contributions are welcomed from neuroscientists at all levels of investigation from in vivo physiology and imaging in humans and monkeys to rodent models in vitro anatomy electrophysiology electroanatomy cellular imaging molecular biology disease models computational modeling and more
