Leffelaar, 2012-12-06 A system may be studied by distinguishing its major components characterizing the changes in them by differential equations that form their simplified representations and then interconnecting these representations to obtain a model of the original system. Developing the model is the systems synthesis phase. The behaviour of the model may now be studied and compared with experimental results obtained from the system. This research method is called systems analysis and simulation. Systems analysis and simulation can serve to make predictions to improve the insight in systems and to test knowledge on consistency and completeness. Predictive models are rare in ecology simply because the underlying processes which form the basis of the models are seldom well known. A successful example of a predictive model was the work of van Keulen 1975. He showed that under semi arid conditions where water is the main factor controlling primary production the simulation technique could predict the production of natural grasslands. Fair predictions could also be made for the Sahelian pastures. Penning de Vries Djiteye 1982. Predictive models of populations of different pest and disease organisms are being used in biological control systems. Zadoks et al 1984.

MacKerron, 2012-12-06 Potato is the fourth major staple food in the world and is still rapidly gaining importance especially in the tropics In May 1994 the second international potato modelling conference was held in Wageningen the Netherlands as a summerschool of the C T de Wit Graduate School The conference was sponsored by DLO SCRI SSCR W AU and the LEB Fund Over 80 scientists participated coming from 16 countries Of each crop physiological and modelling subject a leading scientist was requested to write a review of the most recent developments in his or her field The reviews with highlights from the authors own work are such that the physiological work described is of interest to the modeller and the modelling work to the crop physiologist Applications of the quantitative approach are also reviewed in the concluding chapters that deal with decision support systems breeding and agro ecological zoning An outstanding point of this book is that both the crop ecology and the modelling of a broad range of biotic and abiotic factors are treated by scientists representing groups which are specialized in the subject The two related disciplines met during the conference and thus wrote the chapters with each other s interest in mind The book highlights the limitations for potato growth and development from the viewpoints of both the crop physiologist and the crop systems analyst Systems Analysis and Simulation in Ecology Bernard C. Patten, 2013-09-11 Systems Analysis and Simulation in Ecology Volume IV continues the organization begun in Volume III to document a meeting Modeling and Analysis of Ecosystems held at the University of Georgia on 1 3 March 1973 Several chapters are considerably expanded over their original concept and several others are included which were not part of the symposium The book is organized into five parts Part I contains chapters on estuarine marine ecosystems Part II presents models of several terrestrial ecosystems Part III has chapters devoted to human aspects of ecology Part IV considers special problems of ecosystem modeling namely linear versus nonlinear models aggregation and validation Part V the most extensive section describes theory in ecosystem analysis The book s chapters demonstrate the current scope of systems ecology its past and present emphasis on parts and mechanisms in simulation modeling and its movement toward systems analysis and new more formal consideration of wholes in theory They make clear that although the systems approach is young in ecology it has substantially enriched the science both methodologically and conceptually

Bernard C. Patten, 2013-09-17 Systems Analysis and Simulation in Ecology Volume II concludes the original concept for Systems Analysis and Simulation in Ecology and at the same time initiates a continuing series under the same title The original idea in 1968 was to draw together a collection of systems ecology articles as a convenient benchmark to the state of this emerging new field and as a stimulus to broader interest These purposes will continue to motivate the series in highlighting from time to time accomplishments trends and prospects The present volume is organized into four parts Part I outlines for ecologists the concepts upon which systems science as a discipline is built Part II presents example applications of systems analysis methods to ecosystems Part III is devoted to new theory including an investigation into the feasibility of several nonlinear formulations for use in compartment modeling of ecosystems and the important topic of connectivity in systems Part IV presents a sampling of systems ecology applications It provides a reasonably balanced and accurate picture of the practical capability of ecological systems analysis and simulation Performance does not come up to publicity but prospects for rapid improvement are good given a willingness to let pragmatism guide sound scientific development without demanding unrealistic short term successes      *Computational Methods for Agricultural Research: Advances and Applications*
