Guidelines for brackish water use for agricultural production in the Near East and North Africa region Food and Agriculture Organization of the United Nations, Arab Water Council, 2023-01-26 Water scarcity is one of the major challenges in the 19 countries of the Near East and North Africa NENA region The lack of water is affecting important irrigated areas limiting the increase of food production needed to address the growing demand due to population growth In most countries of the NENA region the need to use non conventional water resources including brackish water is well recognized Brackish water is loosely defined as water that is more saline than freshwater but less saline than seawater It covers a large range of salinity levels from 500 to 30 000 mg l of total dissolved solids TDS Despite the presence of large amounts of brackish water and its potential for use in growing a number of crops it is only used in limited amounts for irrigation The successful use of brackish water for irrigation requires a basic understanding of scientific principles affecting the interactions among the climate the applied water the soil the crop and the environment Equally important is the application of suitable technology and management practices that will facilitate the optional use of this poor quality water The successful use of brackish water requires a higher level of management and likely the adoption of new irrigation management practices Because climate water quality soil type and crop tolerance to salinity vary from location to location guidelines with some degree of site specific flexibility must be developed *Rice Research Strategies for the Future*, 1982 *Soil Resource Inventories and Development Planning*, 1981 **Advances in Soil Science**, 2013-03-07 The world needs for food and fiber continue to increase Population growth in the developing countries peaked at 2.4 percent a year in 1965 and has fallen to about 2.1 percent However in many developing countries almost half the people are under 15 years of age poised to enter their productive and reproductive years The challenges to produce enough food for this growing population will remain great Even more challenging is growing the food in the areas of greatest need Presently the world has great surpluses of food and fiber

in some areas while there are devastating deficiencies in other areas Economic conditions and the lack of suitable infrastructure for distribution all too often limit the alleviation of hunger even when there are adequate supplies sometimes even within the country itself World hunger can only be solved in the long run by increasing crop production in the areas where the population is growing most rapidly This will require increased efforts of both the developed and developing countries Much of the technology that is so successful for crop production in the developed countries cannot be utilized directly in the developing countries Many of the principles however can and must be adapted to the conditions both physical and economic of the developing countries **Handbook of Plant and Crop Stress** Mohammad Pessarakli, 2016-04-19 The dynamic and expanding knowledge of environmental stresses and their effects on plants and crops have resulted in the compilation of a large volume of information in the last ten years since the publication of the second edition of the Handbook of Plant and Crop Stress With 90 percent new material and a new organization that reflects this increase Salt Affected Soils: Reclamation and Management S. K. Gupta, I. C. Mapping of salt-affected soils - Technical manual Food and Agriculture Organization of the United Nations, 2020-08-01 Salt affected soils such as saline or sodic soils are distributed in all continents at various levels of problem intensity They are soils with high amounts of soluble salts and or sodium ions An updated information of their distribution and drivers is a first step towards their sustainable management This book provides technical guidelines and approach for developing a harmonized multiscale soil information of salt affected soils The book is organized into three sections covering seven chapters The sections are sequentially arranged but independently designed to benefit focused readership who may want to go straight to any section Section 1 gives the background information It has three chapters covering existing literature on the characteristics and mapping methods for salt problems in the soil It is intended to illustrate the basic concepts linkage of the characteristics of salt affected soils with input data requirements for their mapping existing classification methods and global distribution of these soils Section 2 covers the methodological procedures for developing multiscale spatial information of salt affected soils It has two chapters describing requirements input data preparation and the procedural steps for developing spatial information of salt affected soils It outlines how data from different sources and characteristics are harmonized and integrated to produce information of salt affected soils Section 3 covers information sharing and resources mobilization when developing information on salt affected soils It gives the guidelines for preparing spatial maps and steps for value addition to benefit end users of the information It also contains a generic training program for building technical capacity for mapping salt affected Research Developments in Saline Agriculture Jagdish Chander Dagar, Rajender Kumar Yadav, Parbodh Chander Sharma, 2019-06-21 Soil and water salinity is a major challenge for the agricultural community and

policy makers in terms of meeting the burgeoning population's demand for food and other agricultural commodities. In coastal regions, climate change and sea level rise will aggravate the problem with more and more areas becoming saline due to intrusion of sea water. As such, there is a pressing need for modern tools and innovative techniques for the identification of salty soils and poor quality waters, crop production, soil reclamation, and lowering the water table in waterlogged areas. Tackling next generation problems such as contamination of soil and underground water due to fluoride and arsenic, as well as developing multi stress tolerant crops, is also a high priority. Further techniques for domesticating halophytes, mangrove based aquacultures using seaweed cultures as agricultural crops, and integrated farming systems need to be perfected. This book addresses all these aspects in detail, highlighting the diverse solutions to tackle the complex problem of salinity and waterlogging and safer management of poor quality waters. With chapters written by leading experts, it is a valuable resource for researchers, planning future investigations, policy makers, farmers, and other stakeholders, and for students wanting insights into vital issues of environment.
