Scheduling Divisible Loads In Parallel And Distributed Systems:

Scheduling Divisible Loads in Parallel and Distributed Systems Veeravalli Bharadwaj, Debasish

Ghose, Venkataraman Mani, Thomas G. Robertazzi, 1996-10-14 This book provides an in depth study concerning a class of problems in the general area of load sharing and balancing in parallel and distributed systems The authors present the design and analysis of load distribution strategies for arbitrarily divisible loads in multiprocessor multicomputer systems subject to the system constraints in the form of communication delays In particular two system architecture single level tree or star network and linear network are thoroughly analyzed The text studies two different cases one of processors with front ends and the other without It concentrates on load distribution strategies and performance analysis and does not cover issues related to implementation of these strategies on a specific system The book collates research results developed mainly by two groups at the Indian Institute of Science and the State University of New York at Stony Brook It also covers results by other researchers that have either appeared or are due to appear in computer science literature The book also provides relevant but easily understandable numerical examples and figures to illustrate important concepts It is the first book in this area and is intended to spur further research enabling these ideas to be applied to a more general class of loads The new methodology introduced here allows a close examination of issues involving the integration of communication and computation In fact what is presented is a new calculus for load sharing problems

Advanced Parallel and Distributed Computing Yuan-Shun Dai, 2007 The field of parallel and distributed computing is undergoing changes at a breathtaking pace Networked computers are now omnipresent in virtually every application from games to sophisticated space missions The increasing complexity heterogeneity largeness and dynamism of the emerging pervasive environments and associated applications are challenging the advancement of the parallel and distributed computing paradigm Many novel infrastructures have been or are being created to provide the necessary computational fabric for realising parallel and distributed applications from diverse domains New models and tools are also being proposed to evaluate and predict the quality of these complicated parallel and distributed systems Current and recent past efforts made to provide the infrastructures and models for such applications have addressed many underlying complex problems and have thus resulted in new tools and paradigms for effectively realising parallel and distributed systems This book showcases these novel tools and approaches with inputs from relevant experts

Parallel and Distributed Computing Alberto Ros, 2010-01-01 The 14 chapters presented in this book cover a wide variety of representative works ranging from hardware design to application development Particularly the topics that are addressed are programmable and reconfigurable devices and systems dependability of GPUs General Purpose Units network topologies cache coherence protocols resource allocation scheduling algorithms peer-to-peer networks largescale network simulation and parallel routines and algorithms In this way the articles included in this book constitute an excellent reference for engineers and researchers who have particular interests in each of these topics in parallel and
