

# Real-Time Scheduling

- Primary goal: ensure predictability
- Secondary goal: ensure predictability
- Typical metrics:
  - Guarantee miss ration = 0 (hard real-time)
  - Guarantee Probability(missed deadline) < X% (firm real-time)
  - Minimize miss ration / maximize completion ration (firm real-time)
  - Minimize overall tardiness; maximize overall usefulness (soft real-time)
- E.g., EDF (Earliest Deadline First, LLF (Least Laxity First), RMS (Rate-Monotonic Scheduling), DM (Deadline Monotonic Scheduling)
- Recall: Real-time is about enforcing predictability, and does not equal to fast computing!!!

## **Scheduling In Real Time Systems:**

Scheduling in Real-Time Systems Francis Cottet, Joëlle Delacroix, Claude Kaiser, Zoubir Mammeri, 2002-11-22 Real time systems are used in a wide range of applications including command and control systems flight control telecommunication systems and online purchase payment Provides an accessible yet comprehensive treatment of real time computing and communications systems Outlines the basics of real time scheduling and scheduling policies designed for real time applications Each chapter contains examples and case studies along with test exercises and solutions *Deadline Scheduling for Real-Time Systems* John A. Stankovic, Marco Spuri, Krithi Ramamritham, Giorgio Buttazzo, 1998-10-31 Many real time systems rely on static scheduling algorithms This includes cyclic scheduling rate monotonic scheduling and fixed schedules created by off line scheduling techniques such as dynamic programming heuristic search and simulated annealing However for many real time systems static scheduling algorithms are quite restrictive and inflexible For example highly automated agile manufacturing command control and communications and distributed real time multimedia applications all operate over long lifetimes and in highly non deterministic environments Dynamic real time scheduling algorithms are more appropriate for these systems and are used in such systems Many of these algorithms are based on earliest deadline first EDF policies There exists a wealth of literature on EDF based scheduling with many extensions to deal with sophisticated issues such as precedence constraints resource requirements system overload multi processors and distributed systems *Deadline Scheduling for Real Time Systems EDF and Related Algorithms* aims at collecting a significant body of knowledge on EDF scheduling for real time systems but it does not try to be all inclusive the literature is too extensive The book primarily presents the algorithms and associated analysis but guidelines rules and implementation considerations are also discussed especially for the more complicated situations where mathematical analysis is difficult In general it is very difficult to codify and taxonomize scheduling knowledge because there are many performance metrics task characteristics and system configurations Also adding to the complexity is the fact that a variety of algorithms have been designed for different combinations of these considerations In spite of the recent advances there are still gaps in the solution space and there is a need to integrate the available solutions For example a list of issues to consider includes preemptive versus non preemptive tasks uni processors versus multi processors using EDF at dispatch time versus EDF based planning precedence constraints among tasks resource constraints periodic versus aperiodic versus sporadic tasks scheduling during overload fault tolerance requirements and providing guarantees and levels of guarantees meeting quality of service requirements *Deadline Scheduling for Real Time Systems EDF and Related Algorithms* should be of interest to researchers real time system designers and instructors and students either as a focussed course on deadline based scheduling for real time systems or more likely as part of a more general course on real time computing The book serves as an invaluable reference in this fast moving field

analysis for some important dynamic scheduling problems in real time systems First we address the problem of selective herbicide spraying in precision farming application The goal is to achieve low weed miss ratio and high CPU utilization We carry out system identification vehicle modeling and controller design In our design the requested CPU utilization is fed back and the vehicle speed is controlled The system model is verified and performance evaluation is carried out through simulation studies The second problem is task scheduling based on m k firm deadline constraints in real time systems The proposed solution feeds back the current dynamic failure rate DFR and adjusts the task s QoS based on DFR on line We also propose a novel fairness metric to evaluate the fairness in QoS among tasks achieved by the scheduler The simulation results show that the QoS of tasks can be improved significantly while keeping the DFR below a certain threshold The third problem is combined task scheduling with fault tolerance in real time systems In our model the rate monotonic scheduling algorithm and deferrable server algorithm are used to schedule periodic and aperiodic tasks respectively By using feedback control technique we adjust the capacity of the deferrable servers based on the failure rate of the periodic tasks The performances of the systems are evaluated through simulation studies The last problem is task scheduling in distributed real time systems We propose a double loop scheme to keep the deadline miss ratio close to the set point and maximize the CPU utilization and analyze the stability of the system in Z domain We also propose a global scheduling method to achieve load balancing by using a suitable load index The performances of the systems are evaluated through simulation studies The feedback based solutions proposed in this dissertation are based on the principle of controlling the trade off between deadline miss ratio and resource utilization This idea can be adapted not only to other scheduling problems in real time systems but also to scheduling problems in non real time systems
