

Individual image

Due to the positioning of our eyes, when objects are closer than about 5.5m (18ft) away, each eye sees a slightly different angle.

Combined image

The incoming signals from both eyes are compared in the brain, and the subtle differences are used to create a three-dimensional image.

Try it for yourself

By holding your hand in front of your face and closing one eye at a time, it is easy to see the different 2D views perceived by each eye.

Robot Vision Gerald Sommer, Reinhard Klette, 2008-01-29 In 1986 B K P Horn published a book entitled Robot Vision which actually discussed a wider eld of subjects basically addressing the eld of computer vision but introducing robot vision as a technical term Since then the teraction between computer vision and research on mobile systems often called robots e g in an industrial context but also including vehicles such as cars wheelchairs tower cranes and so forth established a diverse area of research today known as robot vision Robot vision or more general robotics is a fast growing discipline already taught as a dedicated teaching program at university level The term robot vision addresses any autonomous behavior of a technical system supported by visual sensoric information While robot vision focusses on the vision process visual robotics is more directed toward control and automatization In practice however both elds strongly interact Robot Vision 2008 was the second international workshop counting a 2001 workshop with identical name as the rst in this series Both workshops were organized in close cooperation between researchers from New Zealand and Germany and took place at The University of Auckland New Zealand Participants of the 2008 workshop came from Europe USA South America the Middle East the Far East Australia and of course from New Zealand

Perceiving in Depth, Volume 2: Stereoscopic Vision Ian P. Howard, Brian J. Rogers, 2012-01-27 The three volume work Perceiving in Depth is a sequel to Binocular Vision and Stereopsis and to Seeing in Depth both by Ian P Howard and Brian J Rogers This work is much broader in scope than the previous books and includes mechanisms of depth perception by all senses including aural electrosensory organs and the somatosensory system Volume 1 reviews sensory coding psychophysical and analytic procedures and basic visual mechanisms Volume 2 reviews stereoscopic vision Volume 3 reviews all mechanisms of depth perception other than stereoscopic vision The three volumes are extensively illustrated and referenced and provide the most detailed review of all aspects of perceiving the three dimensional world Volume 2 addresses stereoscopic vision in cats and primates including humans It begins with an account of the physiology of

stereoscopic mechanisms It then deals with binocular rivalry binocular summation binocular masking and the interocular transfer of visual effects such as the motion aftereffect and visual learning The geometry of the region in binocular space that creates fused images the horopter is discussed in some detail Objects outside the horopter produce images with binocular disparities that are used for stereoscopic vision Two chapters provide accounts of mechanisms that bring the images into binocular register and of stimulus tokens that are used to detect binocular disparities Another chapter discusses cyclopean effects such as cyclopean illusions cyclopean motion and binocular direction that are seen only with binocular vision Stereoacuity is the smallest depth interval that can be detected Methods of measuring stereoacuity and factors that influence it are discussed Two chapters deal with the various types of binocular disparity and the role of each type in stereoscopic vision Another chapter deals with visual effects such as figure perception motion perception and whiteness perception that are affected by the relative distances of stimuli The spatiotemporal aspects of stereoscopic vision including the Pulfrich stereomotion effect are reviewed The volume ends with an account of techniques used to create stereoscopic displays and of the applications of stereoscopy

Robotic Vision Peter Corke, 2021-10-15 This textbook offers a tutorial introduction to robotics and Computer Vision which is light and easy to absorb The practice of robotic vision involves the application of computational algorithms to data Over the fairly recent history of the fields of robotics and computer vision a very large body of algorithms has been developed However this body of knowledge is something of a barrier for anybody entering the field or even looking to see if they want to enter the field What is the right algorithm for a particular problem and importantly How can I try it out without spending days coding and debugging it from the original research papers The author has maintained two open source MATLAB Toolboxes for more than 10 years one for robotics and one for vision The key strength of the Toolboxes provide a set of tools that allow the user to work with real problems not trivial examples For the student the book makes the algorithms accessible the Toolbox code can be read to gain understanding and the examples illustrate how it can be used instant gratification in just a couple of lines of MATLAB code The code can also be the starting point for new work for researchers or students by writing programs based on Toolbox functions or modifying the Toolbox code itself The purpose of this book is to expand on the tutorial material provided with the toolboxes add many more examples and to weave this into a narrative that covers robotics and computer vision separately and together The author shows how complex problems can be decomposed and solved using just a few simple lines of code and hopefully to inspire up and coming researchers The topics covered are guided by the real problems observed over many years as a practitioner of both robotics and computer vision It is written in a light but informative style it is easy to read and absorb and includes a lot of Matlab examples and figures The book is a real walk through the fundamentals light and color camera modelling image processing feature extraction and multi view geometry and bring it all together in a visual servo system An authoritative book reaching across fields thoughtfully conceived and brilliantly accomplished Oussama Khatib Stanford
