Necessary Kindling:

Neuropharmacology Methods in Epilepsy Research Steven L. Peterson, 2019-05-07 There is an estimated 2.5 million epileptics in the US and perhaps some 40 million worldwide. As research has become increasingly molecular in scope, fewer scientists are trained in the US on basic integrated epilepsy techniques. One frustration in neuroscience today is the application of state-of-the-art molecular biology techniques to inappropriate animal models of epilepsy, frequently resulting in inconclusive results. Epilepsy research will be increasingly undertaken by scientists well trained in reductionist methodology but who may be unfamiliar with integrated whole animal techniques. This situation appears even more difficult considering there has been no updated textbook on experimental models of epilepsy over the last twenty years until now. Neuropharmacology Methods in Epilepsy Research describes fundamental methodologies and procedures in this field, representing the only detailed text concerning experimental models of epilepsy published in the last 20 years. This guide studies the reproduction of well characterized and readily interpretable experimental models of epilepsy to which state-of-the-art molecular biology techniques can be applied. Each chapter features an Introduction providing a brief background and historical account of the techniques and their use; Methodology describing equipment, solutions, species, electrodes, as well as considering variations of techniques and stimulation parameters; Interpretations demonstrating the relevance of techniques to epilepsy, as well as describing what exactly is being studied and how the data is appropriately applied to understanding epilepsy. Topics include electroshock, chemoconvulsions, kindling, audiogenic seizures, focal seizures, and brain slice preparations. Discussions also include recently developed seizure models including status epilepticus and massed trial simulations; Influence of circadian and diurnal rhythms on convulsive activity; Behavioral and cognitive deficits associated with anticonvulsant drug testing; Technical approaches, i.e. slice models, microdialysis techniques, intracranial implant surgery, audiogenic seizure testing, kindling paradigms, and the rhythmic nature of seizures. This unique text provides a thorough reference for the diverse methodologies within this area of neuropharmacological research, providing the basis for ongoing cellular and molecular investigations as well as novel therapeutic approaches to the treatment of epilepsy. Sensitization in the Nervous System Charles D. Barnes, 2024-11-01 Sensitization is a concept of learning and memory that has grown out of experiments on simple animals. Interest in sensitization has grown tremendously in the last several years, fueled mainly by evidence of the molecular basis of sensitization in invertebrates on the one hand and the study of cocaine abuse which produces behavioral sensitization on the other. Because the rapid advance of information across such a broad range of research areas has made an integrated approach necessary, this volume combines findings on sensitization across the phylogenetic scale. **Out on the Land** Ray Mears, Lars Fält, 2016-09-08 Fifty years into my life journey, I realise that while I love remote wild places and the peoples I meet there, it is in forests that I find the greatest joy. Antisense Research and Application Stanley T. Crooke,2012-12-06 Antisense technology may result in dramatic changes in the therapy of many diseases and may provide tools to dissect pharmacological processes and to confirm the roles of various genes In this volume progress in the understanding of antisense technology and its use in creating new drugs is discussed Potential caveats pitfalls and limitations of the technology are also presented In the next few years the pace at which new molecular targets will be identified will increase exponentially as the sequencing of the human genome and of other genomes proceeds Advances in Stereotactic and Functional Neurosurgery 4 F.J.
