Wafer Fabrication: Factory Performance and Analysis Linda F. Atherton, Robert W. Atherton, 1995-11-30 This book is concerned with wafer fabrication and the factories that manufacture microprocessors and other integrated circuits With the invention of the transistor in 1947 the world as we knew it changed The transistor led to the microprocessor and the microprocessor the guts of the modern computer has created an epoch of virtually unlimited information processing The electronics and computer revolution has brought about for better or worse a new way of life This revolution could not have occurred without wafer fabrication and its associated processing technologies A microprocessor is fabricated via a lengthy highly complex sequence of chemical processes The success of modern chip manufacturing is a miracle of technology and a tribute to the hundreds of engineers who have contributed to its development This book will delineate the magnitude of the accomplishment and present methods to analyze and predict the performance of the factories that make the chips The set of topics covered juxtaposes several disciplines of engineering A primary subject is the chemical engineering aspects of the electronics industry an industry typically thought to be strictly an electrical engineer's playground The book also delves into issues of manufacturing operations performance economics and the dynamics of material movement topics often considered the domain of industrial engineering and operations research Hopefully we have provided in this work a comprehensive treatment of both the technology and the factories of wafer fabrication Novel features of these factories include long process flows and a dominance of processing over operational issues

Structure And Action Of Molecular Chaperones: Machines That Assist Protein

Folding In The Cell Lila M Gierasch, Arthur L Horwich, Christine Slingsby, Sue Wickner, David Agard, 2016-08-08 This unique volume reviews the beautiful architectures and varying mechanical actions of the set of specialized cellular proteins called molecular chaperones which provide essential kinetic assistance to processes of protein folding and unfolding in the cell. Ranging from multisubunit ring shaped chaperonin and Hsp100 machines that use their central cavities to bind and compartmentalize action on proteins to machines that use other topologies of recognition binding cellular proteins in an archway or at the surface of a clamp or at the surface of a globular assembly the structures show us the ways and means the cell has devised to assist its major effectors proteins to reach and maintain their unique active forms as well as when required to disrupt protein structure in order to remodel or degrade. Each type of chaperone is beautifully illustrated by X ray and EM structure determinations at near atomic level resolution and described by a leader in the study of the respective family. The beauty of what Mother Nature has devised to accomplish essential assisting actions for proteins in vivo is fully appreciable.
