S Dreaming And The Development Of Consciousness:

Children's Dreaming and the Development of Consciousness David Foulkes, 2009-07-01 David Foulkes is one of the international leaders in the empirical study of children's dreaming and a pioneer of sleep laboratory research with children. In this book which distills a lifetime of study Foulkes shows that dreaming as we normally understand it active stories in which the dreamer is an actor appears relatively late in childhood. This true dreaming begins between the ages of 7 and 9. He argues that this late development of dreaming suggests an equally late development of waking reflective self awareness. Foulkes offers a spirited defense of the independence of the psychological realm and the legitimacy of studying it without either psychoanalytic over interpretation or neurophysiological reductionism. **The Oxford Companion to**

Consciousness Tim Bayne, Axel Cleeremans, Patrick Wilken, 2009 Consciousness is undoubtedly one of the last remaining scientific mysteries and hence one of the greatest contemporary scientific challenges. How does the brain's activity result in the rich phenomenology that characterizes our waking life? Are animals conscious? Why did consciousness evolve? How does science proceed to answer such questions? Can we define what consciousness is? Can we measure it? Can we use experimental results to further our understanding of disorders of consciousness such as those seen in schizophrenia, delirium or altered states of consciousness? These questions are at the heart of contemporary research in the domain. Answering them requires a fundamentally interdisciplinary approach that engages not only philosophers but also neuroscientists and psychologists in a joint effort to develop novel approaches that reflect both the stunning recent advances in imaging methods as well as the continuing refinement of our concepts of consciousness. In this light the Oxford Companion to Consciousness is the most complete authoritative survey of contemporary research on consciousness. Five years in the making and including over 250 concise entries written by leaders in the field the volume covers both fundamental knowledge as well as more recent advances in this rapidly changing domain. Structured as an easy to use dictionary and extensively cross referenced the Companion offers contributions from philosophy of mind to neuroscience from experimental psychology to clinical findings so reflecting the profoundly interdisciplinary nature of the domain. Particular care has been taken to ensure that each of the entries is accessible to the general reader and that the overall volume represents a comprehensive snapshot of the contemporary study of consciousness. The result is a unique compendium that will prove indispensable to anyone interested in consciousness from beginning students wishing to clarify a concept to professional consciousness researchers looking for the best characterization of a particular phenomenon. *Harris' Developmental Neuropsychiatry* James C. Dream Consciousness Nicholas Tranquillo, 2014-09-01 This book presents three lectures by Allan Hobson entitled The William James Lectures on Dream Consciousness The three lectures expose the new psychology the new physiology and the new philosophy that derive from and support the protoconsciousness hypothesis of dreaming They review in detail many of the studies on sleep and dreaming conducted since the days of Sigmund Freud Following the lectures are commentaries written by scholars whose expertise covers a wide range of scientific disciplines including but not limited to philosophy psychology neurology neuropsychology cognitive science biology and animal sciences The commentaries each answer a specific question in relation to Hobson's lectures and his premise that dreaming is an altered state of consciousness Capitalizing on a vast amount of data the lectures and commentaries provide undisputed evidence that sleep consists of a well organized sequence of subtly orchestrated brain states that undoubtedly play a crucial function in the maintenance of normal brain functions These functions include both basic homeostatic processes necessary to keep the organism alive as well as the highest cognitive functions including perception decision making learning and consciousness
