Infancy to Early

Childhood Robert N. Emde, John K. Hewitt, 2001-04-19 Behavioral genetics is a fast growing multidisciplinary field which attempts to explain the influence of genetic and environmental factors on behavior through the lifespan. The preferred investigative technique for teasing out the differences between genetics and the environment is the longitudinal twin study. This book is the first complete publication from the MacArthur Longitudinal Twin Study MALTS that is by far the most ambitious and comprehensive longitudinal twin study to date. The goal of such an in depth study was not to merely provide thorough descriptions of developmental change between the ages of one and three years but to offer an original theoretical framework that explains how change occurs in different domains and how genetics and the environment influence those changes. This rigorous study will set the agenda for developmental psychology and behavioral genetics for decades to come.

Three Seductive Ideas Jerome Kagan, 2000-04-07 Do the first two years of life really determine a child's future development? Are human beings like other primates only motivated by pleasure? And do people actually have stable traits like intelligence, fear, anxiety, and temperament? This book is the product of a lifetime of research by one of the founders of developmental psychology. It takes on the powerful assumptions behind these questions and proves them mistaken. Ranging with impressive ease from cultural history to philosophy to psychological research literature, Jerome Kagan weaves an argument that will rock the social sciences and the foundations of public policy. Scientists as well as lay people tend to think of abstract processes like intelligence or fear as measurable entities of which someone might have more or less. This approach in Kagan's analysis shows a blindness to the power of context and to the great variability within any individual. Subject to different emotions and circumstances, infant determinism is another widespread and dearly held conviction that Kagan contests. This theory with its claim that early relationships determine lifelong patterns underestimates human resiliency and adaptiveness, both emotional and cognitive, and of course fails to account for the happy products of miserable childhoods and vice versa. The last of Kagan's targets is the vastly overrated pleasure principle which he argues can hardly make sense of unselfish behavior impelled by the desire for virtue and self-respect, the wish to do the right thing. Written in a lively style that uses fables and fairy tales, history and science to make philosophical points, this book challenges some of our most cherished notions about human nature.
