Railways And Energy:

Railways and Energy Liviu Leonard Alston, 1984 A railway vehicle requires substantially less propulsive energy than a road vehicle of the same weight moving at the same speed However other factors favor road transport As a result the ratio of energy consumption by the two modes varies widely depending on service conditions including vehicle characteristics Railways have a substantial energy advantage for large volumes of bulk commodities Part I of this paper reviews measures for increasing the railways energy efficiency and shows that significant gains may be achieved through operational improvements Part II discusses railway electrification Its economic viability depends on the opportunity cost of capital the costs of diesel fuel and of electric power the traffic mix and the nature of the terrain as well as on the capital and maintenance costs of railway works and equipment needed with electric and with diesel traction A series of examples are given and an analysis suitable for prefeasibility studies is presented for estimating the traffic at which electrification becomes economically viable
