Kretzschmar, 2009-03-19 This insightful study proposes a unified theory of speech through which conflicting ideas about language might be understood It is founded on a number of key points such as the continuum of linguistic behaviour extensive variation in language features the importance of regional and social proximity to shared linguistic production and differential frequency as a key factor in linguistic production both in regional and social groups and in text corpora The study shows how this new linguistics of speech does not reject rules in favour of language use or reject language use in favour of rules rather it shows how rules can come from language as people use it Written in a clear engaging style and containing invaluable accessible introductions to complex theoretical concepts this work will be of great interest to students and scholars of sociolinguistics dialectology and corpus linguistics *Multi-dimensional dynamic simulation of rainstorm waterlogging in urban communities* Maohui Zheng, Junbing Liu, Shuai Yao, Jinwei Gao, Simin Jiang, Nianqing Zhou, 2022-11-14 One major threat to cities at present is the increasing rainstorm waterlogging hazards due to climate change and accelerated urbanization This paper explores the mechanism of rainstorm waterlogging and enables the fine simulation of surface water propagation over complex urban terrain A novel community scale waterlogging modeling scheme is presented by loosely coupling a one dimensional sewer model with a two dimensional overland model under an open source framework The coupled model was applied to Waigaoqiao Free Trade Zone located in Pudong New Area of Shanghai To quantify the influence of rainfall intensity and drainage conditions on the waterlogging 12 scenarios were constructed by combining four rainfall return periods 3 5 10 and 20 a and three startup water depths 1 5 2 0 and 2 5 m of pump stations The multi scenario simulation results show that the waterlogging risk increases from north to south in the study area and that risk zones with water depth above 0 3 m are mostly concentrated in the southwest and southeast corners of the site The longer the rainfall return period the larger the submerged area and the spatial distribution of surface water accumulation is affected by local topography and drainage system In addition reducing the startup water depth of pump stations has an obvious effect on inhibiting the severity of water accumulation The results provide insights into overland flow across an urban area with densely populated buildings and help to reduce the risk of rainstorm induced waterlogging disasters **Rainfall and Streamflow from Small Tree-covered and Fern-covered and Burned Water-sheds in Hawaii** Henry Walter Anderson, 1966 *Monthly Weather Review* United States.
