*Quantitative EPR* Gareth R. Eaton, Sandra S. Eaton, David P. Barr, Ralph T. Weber, 2010-04-10. There is a growing need in both industrial and academic research to obtain accurate quantitative results from continuous wave (CW) electron paramagnetic resonance (EPR) experiments. This book describes various sample related, instrument related, and software related aspects of obtaining quantitative results from EPR experiments. Some specific items to be discussed include selection of a reference standard, resonator considerations, Q factor, power saturation, sample position, and finally the blending of all the factors together to provide a calculation model for obtaining an accurate spin concentration of a sample. This book might at first glance appear to be a step back from some of the more advanced pulsed methods discussed in recent EPR texts, but actually quantitative routine CW EPR is a challenging technique and requires a thorough understanding of the spectrometer and the spin system. Quantitation of CW EPR can be subdivided into two main categories: 1. intensity and 2. magnetic field microwave frequency measurement. Intensity is important for spin counting. Both relative intensity quantitation of EPR samples and their absolute spin concentration of samples are often of interest. This information is important for kinetics, mechanism elucidation, and commercial applications where EPR serves as a detection system for free radicals produced in an industrial process. It is also important for the study of magnetic properties. Magnetic field microwave frequency is important for g and nuclear hyperfine coupling measurements that reflect the electronic structure of the radicals or metal ions. Foundations Of

Modern Epr Gareth R. Eaton, Sandra S. Eaton, Kev Salikhov, 1998-05-08. Since its inception 50 years ago, electron paramagnetic resonance (EPR), also called ESR or EMR, has become a major tool in diverse fields ranging from biology and chemistry to solid state physics and materials science. This important book includes personal descriptions of early experiments by pioneers who laid the foundations for the field, perspectives on the state of the art, and glimpses of future opportunities. It presents a broad view of the foundations of EPR and its applications and will therefore appeal to scientists in many fields. Even the expert will find here history not previously recorded and provocative views of future directions. *Nuclear Power Reactor*

Specialist Periodical Reports provide systematic and detailed review coverage of progress in the major areas of chemical research. Written by experts in their specialist fields, the series creates a unique service for the active research chemist, supplying regular, critical, in-depth accounts of progress in particular areas of chemistry. For over 80 years, the Royal Society of Chemistry and its predecessor, the Chemical Society, have been publishing reports charting developments in chemistry, which originally took the form of Annual Reports. However, by 1967, the whole spectrum of chemistry could no longer be contained

within one volume and the series Specialist Periodical Reports was born. The Annual Reports themselves still existed but were divided into two and subsequently three volumes covering Inorganic, Organic and Physical Chemistry. For more general coverage of the highlights in chemistry they remain a must. Since that time the SPR series has altered according to the fluctuating degree of activity in various fields of chemistry. *Free-Radical-Induced DNA Damage and Its Repair* Clemens Sonntag, 2006-03-20. The free radical chemistry of DNA had been discussed in some detail in 1987 in my book *The Chemical Basis of Radiation Biology*. Obviously, the more recent developments and the concomitant higher level of understanding of mechanistic details are missing. Moreover, in the living cell, free radical DNA damage is not only induced by ionizing radiation but free radical induced DNA damage is a much more general phenomenon. It was therefore felt that it is now timely to review our present knowledge of free radical induced DNA damage induced by all conceivable free radical generating sources. Originally it had been thought to include also a very important aspect: the repair of DNA damage by the cell's various repair enzymes. Kevin Prise, Cancer Campaign, Gray Laboratory, London, was so kind to agree to write this part. However, an adequate description of this strongly expanding area would have exceeded the allocated space by much and this section had to be omitted.

The directors of the Max Planck Institut für Strahlenchemie, now MPI für Bioanorganische Chemie, Karl Wieghardt and Wolfgang Lubitz, kindly allowed me to continue to use its facilities after my retirement in 2001. Notably, our librarian Mrs Jutta Theurich and her right hand help Mrs Rosemarie Schreier were most helpful in getting hold of the literature. I thank them very much. Without their constant help, this would have been very difficult indeed.
