

Radioimmunoguided Surgery (RIGS) with ^{99m}Tc -CEA. Scan in Three Patients with Primary Colorectal Cancer

Hell J Nucl Med 2001, 4: 176-178

1. Introduction

In cases where the primary site of colorectal cancer has been identified, it is important to know the sites of possible metastases especially when being too small to be visualized by the various imaging modalities. Metastatic disease not only describes the stage of the disease but also determines the kind of treatment to be followed. In colorectal cancer metastatic disease may be identified either by CT scan, MRI, CEA Scan, radioimmunoscintigraphy (RIS) or by exploratory laparotomy. Recently radioimmunoguided surgery (RIGS) has been applied successfully for the intraoperative detection of metastases and residual tumor in colorectal cancer. A study comparing all four diagnostic modalities mentioned above in 11 patients showed that the sensitivity of CT scan, preoperative MoAb scan, surgical exploration and RIGS were 48%, 67%, 76% and 86% respectively¹. Since reports on the actual evaluation of RIGS are few we describe practical points from our experience in 3 more cases of rectal cancer and discuss the advantages and disadvantages of this procedure.

2. Patients and methods

Three presurgical patients, 2 men [38 years old (A) and 72 years old (B)] and one woman [73 years old (C)] with endoscopically proven rectal cancer, performing radioimmunoguided surgery (RIGS) were prospectively studied. The purpose of this study was explained to the patients who gave their oral consent. The tumors were located in less than 10 cm above the inner anal sphincter. CT scans of the abdomen and pelvis were reported normal. Serum samples were taken for testing CEA, CA 19-9 and CA 50, before the injection of ^{99m}Tc labeled CEA antibodies. The above markers were in the normal range except for Patient A who had CEA of 33 ng/ml (normal range 0-10 ng/ml) and CA19-9 of 43.6 U/ml (normal range 0-37 U/ml). Radioimmunoscintigraphy was performed 3-5 hours after the intravenous injection of 740-925 MBq of sodium pertechnetate ($\text{Na}_2^{99m}\text{TcO}_4$) labeled IgG₁ fab' fragment (IMMU4, CEA-Scan, Immunomedics Inc). Planar images were normal except in Patient A who had abnormal uptake of the radiopharmaceutical in his testis due to bilateral varicocele. Unfortunately SPET

images were not obtained because of a technical problem.

The patients underwent probe-guided surgery 20-24 hours after the injection of the radiopharmaceutical. A portable probe (Scintiprobe MR 100, Biomedical Instruments) was used. The Scintiprobe MR 100 we used has 2 units. The central unit is a hand portable digital counter coupled with a variable frequency generator with adjustable volume sound threshold setting with two independent energy windows. It is of 10 kg weight, connected to a hardware with a graphic program able to give counts per second, real time visualization, counting rate visualization as a function of time, energy spectra visualization for calibration purposes, statistical calculation program and to store measurements and patient data. The probe has a NaI crystal with a total length of 160 mm, external diameter of 18 mm, lateral shielding efficiency > 99.99%, sensitivity threshold of 3.7 kBq, and gamma radiation detecting efficiency of 99%². The energy windows were set for ^{99m}Tc . A sterile dressing was drawn over the probe during surgery.

The surgical procedure was initiated with a xipho-pubic midline incision. A traditional exploration was performed by inspection and palpation. Then using the Scintiprobe, detection and evaluation of counts over different surgical tissues was done. The

threshold level of the probe signal processor was adjusted to eliminate the background sound over normal tissues. The Scintiprobe digital counter was connected to a computer, thus the measurements were

Lymphatic Metastasis and Sentinel Lymphonodectomy P.M. Schlag, Umberto Veronesi, 2012-12-06 Metastases determine malignancy The main attention so far has been focused upon organ metastases The molecular mechanisms thereof while far from being totally elucidated are increasingly well understood Modern diagnostic tools now enable detection and precise localization of small lesions In contrast our knowledge and diagnostic capabilities regarding metastatic spread to the lymphatic system are rather limited However there have recently been a number of interesting advances It is the aim of this volume to submit these developments to detailed analysis The therapeutic relevance of enhanced sensitivity in detection of lymph node metastases has to be considered in the light of increased morbidity versus eventual prognostic improvements by modification of therapy An interesting concept which might improve diagnostic accuracy while reducing operative morbidity is the sentinel node technique Surgical standards are lacking however and many fundamental questions pertaining to precise lymphatic mapping remain unanswered Whether the sentinel node concept is of general relevance or whether it is applicable in only a few organs remains to be determined This book offers intensive discussion of the concept from methodological and tumor biological viewpoints World renowned experts with long term involvement in related basic and clinical research provide the reader with a broad survey of actual knowledge together with a critical appraisal of recent and future developments We sincerely hope this book succeeds in providing an outlook as a reference for all clinicians on future prospects and serving and researchers in this extremely important field

Peritoneal Carcinomatosis: Principles of Management Paul H. Sugarbaker, 2012-12-06
Paul Sugarbaker and his colleagues have persevered in the study and treatment of peritoneal carcinomatosis. The peritoneal cavity has many unique and incompletely appreciated properties. These properties coupled with the biologic behavior of many cancers results in the seeding and growth of these cancers on the peritoneum. Many of these cancers remain localized to the peritoneum only, never metastasizing to other sites. One possible reason for this may be the obstruction of the afferent lymphatics on the undersurface of the diaphragm. The mucopolysaccharides produced by many of these neoplasms are probably viscous enough to obstruct these lymphatics, leading to the syndrome of pseudomyxoma peritonei. Many of the neoplasms taking residence on the peritoneum have extremely long cell cycle times and are resistant to radiotherapy and many chemotherapeutic agents. However, much can be done for these patients: resection of primary cancers, omentectomies to reduce ascites formation, management of recurrent ascites, management of intestinal obstruction, nutritional care, and hopefully intraperitoneal chemotherapy. We have reviewed many of these problems in the past.^{1,7} Dr. Sugarbaker and his colleagues have organized the current state of knowledge and technology for continuing use. The book provides a basis for thoughtful prospective research planning. John S.
