Advancing the Frontiers of Simulation Christos Alexopoulos, David Goldsman, James R. Wilson, 2009-09-18 This Festschrift honors George Samuel Fishman one of the founders of the field of computer simulation and a leader of the disciplines of operations research and the management sciences for the past few decades on the occasion of his seventieth birthday The papers in this volume span the theory methodology and application of computer simulation The lead article is appropriately titled George Fishman's Professional Career In this article we discuss George's contributions to operations research and the management sciences with special emphasis on his role in the advancement of the field of simulation since the 1960s We also include a brief personal biography together with comments by several individuals about the extraordinary effect that George has had on all his students colleagues and friends This second article titled A Conversation with George Fishman is the transcript of an extended interview with George that we conducted in October 2007 In the article titled Computer Intensive Statistical Model Building Russell Cheng studies resampling methods for building parsimonious multiple linear regression models so as to represent accurately the behavior of the dependent variable in terms of the smallest possible subset of explanatory independent variables The author shows how bootstrap resampling can be used not only for rapid identification of good models but also for efficient comparison of competing models

Experimental Methods for the Analysis of Optimization Algorithms Thomas Bartz-Beielstein, Marco Chiarandini, Luís Paquete, Mike Preuss, 2010-11-02 In operations

research and computer science it is common practice to evaluate the performance of optimization algorithms on the basis of computational results and the experimental approach should follow accepted principles that guarantee the reliability and reproducibility of results. However, computational experiments differ from those in other sciences and the last decade has seen considerable methodological research devoted to understanding the particular features of such experiments and assessing the related statistical methods. This book consists of methodological contributions on different scenarios of experimental analysis. The first part overviews the main issues in the experimental analysis of algorithms and discusses the experimental cycle of algorithm development; the second part treats the characterization by means of statistical distributions of algorithm performance in terms of solution quality, runtime and other measures; and the third part collects advanced methods from experimental design for configuring and tuning algorithms on a specific class of instances with the goal of using the least amount of experimentation. The contributor list includes leading scientists in algorithm design, statistical design, optimization and heuristics, and most chapters provide theoretical background and are enriched with case studies. This book is written for researchers and practitioners in operations research and computer science who wish to improve the experimental assessment of optimization algorithms and consequently their design.

Handbook of Design and Analysis of Experiments Angela Dean, Max Morris, John Stufken, Derek Bingham, 2015-06-26. This carefully edited collection

synthesizes the state of the art in the theory and applications of designed experiments and their analyses. It provides a detailed overview of the tools required for the optimal design of experiments and their analyses. The handbook covers many recent advances in the field, including designs for nonlinear models and algorithms applicable to a wide variety of design problems. It also explores the extensive use of experimental designs in marketing, the pharmaceutical industry, engineering and other areas.

Optimal Design of Experiments Peter Goos, Bradley Jones, 2011-06-28. This is an engaging and informative book on the modern practice of experimental design. The authors' writing style is entertaining; the consulting dialogs are extremely enjoyable and the technical material is presented brilliantly but not overwhelmingly. The book is a joy to read. Everyone who practices or teaches DOE should read this book. Douglas C. Montgomery, Regents Professor, Department of Industrial Engineering, Arizona State University. It's been said: Design for the experiment, don't experiment for the design. This book ably demonstrates this notion by showing how tailor-made optimal designs can be effectively employed to meet a client's actual needs. It should be required reading for anyone interested in using the design of experiments in industrial settings. Christopher J. Nachtsheim, Frank A. Donaldson Chair in Operations Management, Carlson School of Management, University of Minnesota. This book demonstrates the utility of the computer-aided optimal design approach using real industrial examples. These examples address questions such as the following: How can I do screening inexpensively if I have dozens of factors to investigate? What can I do if I have day-to-day variability and I can only perform 3 runs a day? How can I do RSM cost effectively if I have categorical factors? How can I design and analyze experiments when there is a factor that

can only be changed a few times over the study How can I include both ingredients in a mixture and processing factors in the same study How can I design an experiment if there are many factor combinations that are impossible to run How can I make sure that a time trend due to warming up of equipment does not affect the conclusions from a study How can I take into account batch information in when designing experiments involving multiple batches How can I add runs to a botched experiment to resolve ambiguities While answering these questions the book also shows how to evaluate and compare designs This allows researchers to make sensible trade offs between the cost of experimentation and the amount of information they obtain

Design and Analysis of Simulation Experiments Jack P.C. Kleijnen, 2007-11-15 Simulation is a widely used methodology in all Applied Science disciplines This textbook focuses on this crucial phase in the overall process of applying simulation and includes the best of both classic and modern methods of simulation experimentation This book will be the standard reference book on the topic for both researchers and sophisticated practitioners and it will be used as a textbook in courses or seminars focusing on this topic

Theory of Factorial Design Ching-Shui Cheng, 2016-04-19 Bringing together both new and old results Theory of Factorial Design Single and Multi Stratum Experiments provides a rigorous systematic and up to date treatment of the theoretical aspects of factorial design To prepare readers for a general theory the author first presents a unified treatment of several simple designs including completely randomized designs block designs and row column designs As such the book is accessible to readers with minimal exposure to experimental design With exercises and numerous examples it is suitable as a reference for researchers and as a textbook for advanced graduate students In addition to traditional topics and a thorough discussion of the popular minimum aberration criterion the book covers many topics and new results not found in existing books These include results on the structures of two level resolution IV designs methods for constructing such designs beyond the familiar foldover method the extension of minimum aberration to nonregular designs the equivalence of generalized minimum aberration and minimum moment aberration a Bayesian approach and some results on nonregular designs The book also presents a theory that provides a unifying framework for the design and analysis of factorial experiments with multiple strata error terms arising from complicated structures of the experimental units This theory can be systematically applied to various structures of experimental units instead of treating each on a case by case basis

The Design and Analysis of Computer Experiments Thomas J. Santner, Brian J. Williams, William I. Notz, 2019-01-08 This book describes methods for designing and analyzing experiments that are conducted using a computer code a computer experiment and when possible a physical experiment Computer experiments continue to increase in popularity as surrogates for and adjuncts to physical experiments Since the publication of the first edition there have been many methodological advances and software developments to implement these new methodologies The computer experiments literature has emphasized the construction of algorithms for various data analysis tasks design construction prediction sensitivity analysis calibration among others and the development of web based repositories of

designs for immediate application While it is written at a level that is accessible to readers with Masters level training in Statistics the book is written in sufficient detail to be useful for practitioners and researchers New to this revised and expanded edition An expanded presentation of basic material on computer experiments and Gaussian processes with additional simulations and examples A new comparison of plug in prediction methodologies for real valued simulator output An enlarged discussion of space filling designs including Latin Hypercube designs LHDs near orthogonal designs and nonrectangular regions A chapter length description of process based designs for optimization to improve good overall fit quantile estimation and Pareto optimization A new chapter describing graphical and numerical sensitivity analysis tools Substantial new material on calibration based prediction and inference for calibration parameters Lists of software that can be used to fit models discussed in the book to aid practitioners
