DESIGN, SYNTHESIS AND CONTROL OF A MECHANICAL SERVO PRESS: AN INDUSTRIAL Education, 1984 APPLICATION, Abstract Due to precision flexibility simplicity in construction easy control higher speed and lower energy consumptions servo presses have recently become popular in metal forming applications Servo press technology combines the advantages of hydraulic and conventional mechanical presses without their drawbacks This study presents design construction and demonstration of a servo crank press system for metal forming operations. The research involves kinematics and motion optimization dynamic modeling structural design and analysis servo motor selection automation and control and operational performances of the servo press The press used in this work has a load capacity of 50 ton and stroke capacity of 200 mm Firstly optimized trajectories of ram scenarios are generated Then dynamic modeling using Lagrange approach is presented Next structural model is constructed and Finite Element Analysis FEA of press parts are performed within safety limits A servo motor with a reduction unit is selected based on dynamic model After that a new automation system is developed and Cascade Feed Forward CasFF control is applied Moreover four motion scenarios crank dwell link and soft motion are employed for the performance assessment of press Finally the dynamic model is verified by the experimental results The research study is carried out under support and grant of an industrial project aiming to provide know how to industry and researchers Key Words Servo crank press metal forming motion design dynamic modeling system control

Mechanics of Fiber and Textile Reinforced Cement Composites Barzin Mobasher,2011-09-20 Among all building materials concrete is the most commonly used and there is a staggering demand for it However as we strive to build taller structures with improved seismic resistance or durable pavement with an indefinite service life we require materials with better performance than the conventional materials used today Considering the enormous investment in public infrastructure and society s need to sustain it the need for new and innovative materials for the repair and rehabilitation of civil infrastructure becomes more evident These improved properties may be defined in terms of carbon footprint life cycle cost durability corrosion resistance strength ductility and stiffness Addressing recent trends and future directions Mechanics of Fiber and Textile Reinforced Cement Composites presents new opportunities for developing innovative and cost effective

materials and techniques in cement and concrete composites manufacturing testing and design The book offers mathematical models experimental results and computational algorithms for efficient designs with fiber and textile reinforced composite systems. It explores alternative solutions using blended cements innovative reinforcing systems natural fibers experimental characterization of key parameters used for design and optimized designs. Each chapter begins with a detailed introduction supplies a thorough overview of the existing literature and sets forth the reasoning behind the experimentation and theory. Documenting the composite action of fibers and textiles the book develops and explains methods for manufacturing and testing cement composites. Methods to design and analyze structures for reduced weight increased durability and minimization of cement use are also examined. The book demonstrates that using a higher volume fraction of fiber systems can result in composites that are quasi elastic plastic Speaking to the need to optimize structural performance and sustainability in construction this comprehensive and cohesive reference requires readers to rethink the traditional design and manufacturing of reinforced concrete structures.
