**Science, Technology & Society** ,1998      **Silane Coupling Agents** E.P. Plueddemann, 2013-11-11 Much progress has been made in the last 8 years in understanding the theory and practice of silane coupling agents A major advance in this direction was the measurement of true equilibrium constants for the hydrolysis and formation of siloxane bonds Equilibrium constants for bond retention are so favorable that a silane coupling agent on silica has a thousandfold advantage for bond retention in the presence of water over an alkoxysilane bond formed from hydroxy functional polymers and silica In practice the bonds of certain epoxies to silane primed glass resist debonding by water about a thousand times as long as the epoxy bond to unprimed glass Oxane bonds of silane coupling agents to metal oxides seem to follow the same mechanism of equilibrium hydrolysis and rebonding although equilibrium constants have not been measured for individual metal oxygen silicon bonds This suggests however that methods of improving bond retention to glass will also improve the water resistance of bonds to metals of standard coupling agents with a hydrophobic silane or one Modification with extra siloxane cross linking have improved the water resistance of bonds to glass and metals another hundredfold over that obtained with single coupling agents      Understanding New Media Kim H.
