Random Functions and Turbulence S. Panchev, 2016-10-27 International Series of Monographs in Natural Philosophy Volume 32 Random Functions and Turbulence focuses on the use of random functions as mathematical methods The manuscript first offers information on the elements of the theory of random functions Topics include determination of statistical moments by characteristic functions functional transformations of random variables multidimensional random variables with spherical symmetry and random variables and distribution functions The book then discusses random processes and random fields including stationarity and ergodicity of random processes influence of finiteness of the interval of averaging scalar and vector random fields and statistical moments The text takes a look at the statistical theory of turbulence Topics include turbulence with very large Reynolds numbers emergence of turbulent motion and energy spectrum in isothermal turbulent shear flow The book also discusses small scale and large scale atmospheric turbulence and

applications to numerical weather analysis and prediction The manuscript is a vital source of data for readers interested in random theory

Optimal Control Systems by AA Fel'Dbaum, 1966-01-01 In this book we study theoretical and practical aspects of computing methods for mathematical modelling of nonlinear systems A number of computing techniques are considered such as methods of operator approximation with any given accuracy operator interpolation techniques including a non Lagrange interpolation methods of system representation subject to constraints associated with concepts of causality memory and stationarity methods of system representation with an accuracy that is the best within a given class of models methods of covariance matrix estimation methods for low rank matrix approximations hybrid methods based on a combination of iterative procedures and best operator approximation and methods for information compression and filtering under condition that a filter model should satisfy restrictions associated with causality and different types of memory As a result the book represents a blend of new methods in general computational analysis and specific but also generic techniques for study of systems theory and its particular branches such as optimal filtering and information compression Best operator approximation Non Lagrange interpolation Generic Karhunen Loeve transform Generalised low rank matrix approximation Optimal data compression Optimal nonlinear filtering

Statistics of Random Processes I R.S. Liptser, A.N. Shiryaev, 2013-11-11 A considerable number of problems in the statistics of random processes are formulated within the following scheme On a certain probability space Q P a partially observable random process I_t $t \geq 0$ is given with only the second component n_t $t \geq 0$ observed At any time t it is required based on h_t $s \leq t$ to estimate the unobservable state I_t This problem of estimating in other words the filtering problem 0 from h will be discussed in this book It is well known that if M_t $t \geq 0$
