Kosorok, Erica E. M. Moodie, 2015-12-08

Personalized medicine is a medical paradigm that emphasizes systematic use of individual patient information to optimize that patient's health care particularly in managing chronic conditions and treating cancer. In the statistical literature, sequential decision making is known as an adaptive treatment strategy (ATS) or a dynamic treatment regime (DTR). The field of DTRs emerges at the interface of statistics, machine learning, and biomedical science to provide a data-driven framework for precision medicine. The authors provide a learning-by-seeing approach to the development of ATSs aimed at a broad audience of health researchers. All estimation procedures used are described in sufficient heuristic and technical detail so that less quantitative readers can understand the broad principles underlying the approaches. At the same time, more quantitative readers can implement these practices. This book provides the most up-to-date summary of the current state of the statistical research in personalized medicine. It contains chapters by leaders in the area from both the statistics and computer sciences fields and also contains a range of practical advice, introductory and expository materials, and case studies. **Decision**

**Making in Neurovascular Disease** Leonardo Rangel-Castilla, Peter Nakaji, Adnan H. Siddiqui, 2018-05-07. Neurovascular medicine has emerged as an established semi-independent subspecialty of neurology and neurosurgery. Decision Making in Neurovascular Disease focuses on the challenging process of determining the best approach for managing patients with intracranial atherosclerosis, carotid artery disease, stroke, aneurysms, arteriovenous malformations, arteriovenous fistulae, cavernous malformations, and hypervascular tumors.
