Advanced Metallization for Future ULSI: Volume 427 Materials Research Society. Meeting,1996-11-08 The feature sizes of microelectronic devices have entered the deep submicron regime The process integration and structure properties control of the multilevel metal circuitry demand an interdisciplinary interaction and understanding between manufacturing and research To realize the vision presented in the national technology road map material and technological challenges will need to be overcome For example Cu conductor and its barrier metals and low dielectric constant insulators are at issue For materials processing chemical mechanical planarization and low temperature filling of high aspect ratio vias are challenges For materials examination the metrology of submicron structures is nontrivial and for materials reliability the interplay among multiple driving forces and the response in small dimension microstructures are intriguing These issues are the focus of this book from MRS Topics include road map technology and metrology of submicron device structures reliability issues for Cu metallization Al interconnects and vias barrier metal interlevel low K dielectrics and contact to Si and compound semiconductors **Semiconductor Process and Device Performance Modelling: Volume 490** Scott T. Dunham,Jeffrey S. Nelson,1998-10-02 Highlights recent advances in technology computer aided design TCAD and identifies critical areas for future emphasis The 39 contributions from the December 1997 symposium cover four main topics bulk process modeling equipment modeling topography modeling and characterization and device modeling Paper topics include arsenic deactivation in silicon defect reactions induced by reactive ion etching optimization of AMT barrel reactors for silicon epitaxy grain structure evolution and the reliability of Al Cu thin film interconnects and improved quantitative mobility spectrum

Mulder, C. Schmidt, V. Vogel, 1998-11-16 The 34 papers investigate the processing routes and properties of the complex molecular and macromolecular structures that hold biological cells together both to reveal some of the mysteries of cell function and to identify natural solutions for optimizing membranes that might be adapted for applications in materials science They cover the mechanics of DNA the cytoskeleton semiflexible polymers polyelectrolytes and motor proteins properties and models of membranes and their interactions with macromolecules biomaterials and cells and cellular processes Annotation copyrighted by Book News Inc Portland OR Electrical, Optical and Magnetic Properties of Organic Solid-State Materials IV: Volume 488 John R. Reynolds, 1998-05-06 This book shows that research involving electrical optical and magnetic properties of organic solid state materials continues to grow both in scope and technological importance Early

studies of charge transport in conducting polymers have evolved from the elucidation of fundamental structure function relationships to applications such as batteries simple electrical devices such as diodes chemical sensors antistatic coatings microwave and millimeter wave absorbing materials and photochromic devices A particularly exciting evolution has been the discovery and development of organic light emitting diodes OLEDs which appear to be nearing commercialization in an amazingly short period of time This application is of particular interest because both electrical and optical properties must be considered Topics include organic light emitting materials and devices photonic materials and devices conducting and electroactive polymers and materials molecular and supramolecular engineering organic metals and magnetic materials and poster presentations
