Rapidly Quenched Metals C. Suryanarayana, 2014-08-15 *Rapidly Quenched Metals* C. Suryanarayana, 2014-09-12

Professor Pol Duwez of the California Institute of Technology Pasadena USA developed a method in 1960 to solidify metallic melts at cooling rates exceeding about 10^5 K/sec. It was shown that under these non equilibrium conditions it was possible to obtain supersaturated solid solutions, metastable crystalline intermediate phases and even amorphous phases under appropriate quenching conditions and for suitable alloy compositions. Subsequently several other techniques have also been developed to achieve these non equilibrium effects. A common feature of all these rapid quenching techniques now collectively referred to as splat quenching, liquid quenching, melt quenching or liquid jet quenching is that quenching is carried out from the liquid state at very high cooling rates. However the shape and size of the quenched product may be different depending on the technique employed. The method of melt spinning in which a continuous stream of liquid jet is impinged against a conducting wheel rotating at a high speed has become the most popular since long and continuous ribbons of uniform cross section can be obtained. Although started only about 20 years ago the rapid quenching technique has come to be established as a standard method to produce metastable effects. The activity in this area is now world wide as evidenced by the organization of three international conferences devoted exclusively to this topic. The first one was held in Brela Yugoslavia 1970, the second in Massachusetts Cambridge USA 1975 and the third at Sussex UK 1978. Rapidly Quenched Metals C. Suryanarayana, 2012-05-09.
