

Chapter 15

Landforms Made by Running Water

Often regarded as the most remote inhabited island in the world, Easter Island lies about 3500 km (about 2200 mi) west of the Chilean coast. First settled by Polynesians about a thousand years ago, the volcanic island has a complicated history, punctuated by famine, epidemics, civil war, slave raids, colonialism, and near deforestation. Because of forest clearing, agriculture, and sheep farming throughout most of the twentieth century, soil erosion has been severe in some island regions, where overland flow and streamflow have created a branching network of gullies in the red soil that drains an ancient lava plateau.

Tourism in Changing Natural Environments Natalie Ooi, Esther A. Duke, Joseph O'Leary, 2020-05-21 Natural environments and the human interactions that occur within are continuously changing and evolving This comprehensive volume explores how the impacts of climate change natural and man made disasters economic instability and other macro environmental factors can have profound implications for local and global economies fragile ecosystems and human cultures and livelihoods The authors examine the numerous ways in which changes in the natural environment impact tourism and how the tourism industry is responding and adapting to such changes in both developed and developing regions Through the various case studies that examine human interaction within what are often

fragile ecosystems this book makes it clear that while adaptation can be passive in nature it can and should be much more proactive with individuals and organizations seeking improved knowledge and learning Such actions will contribute to greater resilience within the tourism industry whether in response to climate change and its subsequent impacts or an increasing scarcity of the natural resources upon which tourism relies This book was originally published as a special issue of the journal Tourism Geographies *Environmental Toxicology and Chemistry* ,2005 Parameter Estimation and Uncertainty Quantification in Water Resources Modeling Philippe Renard,Frederick Delay,Daniel M. Tartakovsky,Velimir V. Vesselinov,2020-04-22 Numerical models of flow and transport processes are heavily employed in the fields of surface soil and groundwater hydrology They are used to interpret field observations analyze complex and coupled processes or to support decision making related to large societal issues such as the water energy nexus or sustainable water management and food production Parameter estimation and uncertainty quantification are two key features of modern science based predictions When applied to water resources these tasks must cope with many degrees of freedom and large datasets Both are challenging and require novel theoretical and computational approaches to handle complex models with large number of unknown parameters
