Cercignani, 2013-12-11 **NASA Technical Note**, 1974 **Advances in Hypersonics** BALLMAN, BERTIN, PERIAUX, 2012-12-06 These three volumes entitled Advances in Hypersonics contain the Proceedings of the Second and Third Joint US Europe Short Course in Hypersonics which took place in Colorado Springs and Aachen The Second Course was organized at the US Air Force Academy USA in January 1989 and the Third Course at Aachen Germany in October 1990 The main idea of these Courses was to present to chemists computer scientists engineers experimentalists mathematicians and physicists state of the art lectures in scientific and technical disciplines including mathematical modeling computational methods and experimental measurements necessary to define the aerothermodynamic environments for space vehicles such as the US Orbiter or the European Hermes flying at hypersonic speeds The subjects can be grouped into the following areas Physical environments configuration requirements propulsion systems including airbreathing systems experimental methods for external and internal flow theoretical and numerical methods Since hypersonic flight requires highly integrated systems the Short Courses not only aimed to give in depth analysis of hypersonic research and technology but also tried to broaden the view of attendees to give them the ability to understand the complex problem of hypersonic flight Most of the participants in the Short Courses prepared a document based on their presentation for reproduction in the three volumes Some authors spent considerable time and energy going well beyond their oral presentation to provide a quality assessment of the state of the art in their area of expertise as of 1989 and 1991

Hastie, 1979 **Treatise on Solid State Chemistry** N. Hannay, 2012-12-06 The last quarter century has been marked by the extremely rapid growth of the solid state sciences They include what is now the largest subfield of physics and the materials engineering sciences have likewise flourished And playing an active role throughout this vast area of science and

engineering have been very large numbers of chemists. Yet even though the role of chemistry in the solid state sciences has been a vital one and the solid state sciences have in turn made enormous contributions to chemical thought, solid state chemistry has not been recognized by the general body of chemists as a major subfield of chemistry. Solid state chemistry is not even well defined as to content. Some, for example, would have it include only the quantum chemistry of solids and would reject thermodynamics and phase equilibria; this is nonsense. Solid state chemistry has many facets and one of the purposes of this Treatise is to help define the field. Perhaps the most general characteristic of solid state chemistry and one which helps differentiate it from solid state physics is its focus on the chemical composition and atomic configuration of real solids and on the relationship of composition and structure to the chemical and physical properties of the solid. Real solids are usually extremely complex and exhibit almost infinite variety in their compositional and structural features.

Direct Methods for Solving the Boltzmann Equation and Study of Nonequilibrium Flows V.V.

Aristov, 2012-12-06 This book is concerned with the methods of solving the nonlinear Boltzmann equation and of investigating its possibilities for describing some aerodynamic and physical problems. This monograph is a sequel to the book *Numerical direct solutions of the kinetic Boltzmann equation* in Russian which was written with F. G. Tcheremissine and published by the Computing Center of the Russian Academy of Sciences some years ago. The main purposes of these two books are almost similar, namely the study of nonequilibrium gas flows on the basis of direct integration of the kinetic equations. Nevertheless, there are some new aspects in the way this topic is treated in the present monograph. In particular, attention is paid to the advantages of the Boltzmann equation as a tool for considering nonequilibrium nonlinear processes. New fields of application of the Boltzmann equation are also described. Solutions of some problems are obtained with higher accuracy. Numerical procedures such as parallel computing are investigated for the first time. The structure and the contents of the present book have some common features with the monograph mentioned above, although there are new issues concerning the mathematical apparatus developed so that the Boltzmann equation can be applied for new physical problems. Because of this, some chapters have been rewritten and checked again and some new chapters have been added.

Rotational-temperature Determination in Flowing Nitrogen Using an Electron Beam D. C. Lillicrap, L. P. Lee, 1971 The measurement of rotational temperature by the electron beam fluorescence technique is investigated for temperatures between 78 K and 300 K by using the 0-0 band of the nitrogen first negative system. Existing methods for calculating the rotational temperature from electron beam spectra result in values which are higher than the true temperature and the error increases with density and electron beam current. The errors are believed to arise through neglect of the effects of secondary electrons. Excitation by low energy secondary electrons can increase the population of the sparsely populated rotational ground states at the expense of the abundantly populated states. This secondary excitation is proposed as the cause of the

error in the calculated rotational temperature and a theoretical study determines that the density and beam current govern the excitation rate Rotational temperature measurements are made in a flowing stream of nitrogen at a known temperature for a range of densities and beam currents
