Offshore Mobile Drilling Units, 1973 **Rules for Building and Classing Underwater Systems and Vehicles,** 1979 American Bureau of Shipping, 1979 **Marine safety manual** United States. Coast Guard, 1985 **NBS Special Publication**, 1975 An Index of U.S. Voluntary Engineering Standards, Supplement 2 William J. Slattery, 1975 **An Index of U.S. Voluntary Engineering Standards. Supplement** William J. Slattery, 1972 Fracture-control Guidelines for Welded Steel Ship Hulls Stanley Theodore Rolfe, David M. Rhea, Bogdan O. Kuzmanovic, 1974 The Report provides comprehensive toughness criteria for welded ship hulls that can be used for steels of all strength levels Because of the fact that stress concentrations are always present in large complex welded structures and therefore high stresses as well as discontinuities or flaws will be present in welded ship hulls primary emphasis in the proposed fracture control guidelines is placed on the use of steels with moderate levels of notch toughness and on the use of properly designed crack arresters In general concepts of fracture mechanics are used to develop the material toughness level that is required for fail safe operation of welded ship hulls *Marine Safety Manual: Technical* United States. Coast Guard, 1985 **The Code of Federal Regulations of the United States of America**, 2002 The Code of Federal Regulations is the codification of the general and permanent rules published in the Federal Register by the executive departments and agencies of the Federal Government Code of Federal Regulations, 2002 Special edition of the Federal Register containing a codification of documents of general applicability and future effect with ancillaries **Examination of Service and Stress Data of Three Ships for Development of Hull Girder Load Criteria** J. F. Dalzell, N. M. Maniar, M. W. Hsu, 1979 This is a follow on project to SSC 240 Load Criteria for Ship Structural Design which proposed methods for the estimation and superposition of the primary loads and performed sample calculations for one conventional dry cargo ship It involved the following bending moments still water due to weight and buoyancy ships own wave train quasi static wave induced vertical and lateral combined dynamic loads including slamming whipping and springings and thermal effects Here the service and full scale stress data of three larger and or faster ships Containership SL 7 Bulk Carrier FOTINI L and very large Crude Carrier UNIVERSE IRELAND are examined for the purpose of the eventual development of hull girder criteria The examination is limited to extreme midship bending moment loads which are related to the ultimate strength An assessment is made of the compatibility between the service and stress data of the distinctly different study ships and the analysis methods of SSC 240 and their assumptions for cargo ship type Considerable insight is obtained into the probable correct mathematical approximations of the loads and their interrelationships It appears that still water bending moments can be approached probabilistically however considerable additional information on experienced loading conditions must be gathered to determine the statistical distributions Additional effort is required to determine the suitable probabilistic expression and a synthesis method for the contribution of vibration to the extreme load Author *Federal Register*, 1988-06-06 *Code of*
