Electron Backscatter Diffraction in Materials Science Adam J. Schwartz, Mukul Kumar, Brent L. Adams, David P. Field, 2013-06-29 Crystallographic texture or preferred orientation has long been known to strongly influence material properties Historically the means of obtaining such texture data has been through the use of x ray or neutron diffraction for bulk texture measurements or transmission electron microscopy or electron channeling for local crystallographic information In recent years we have seen the emergence of a new characterization technique for probing the microtexture of materials This advance has come about primarily through the automated indexing of electron backscatter diffraction EBSD patterns The first commercially available system was introduced in 1994 and since then of sales worldwide has been dramatic This has accompanied widening the growth applicability in materials science problems such as microtexture phase identification grain boundary character distribution deformation microstructures etc and is evidence that this technique can in some cases replace more time consuming transmission electron microscope TEM or x ray diffraction investigations The benefits lie in the fact that the spatial resolution on new field emission scanning electron microscopes SEM can approach 50 nm but spatial extent can be as large as a centimeter or greater with a computer controlled stage and mounting of the images Additional benefits include the relative ease and low cost of attaching EBSD hardware to new or existing SEMs Electron backscatter diffraction is also known as backscatter Kikuchi diffraction BKD or electron backscatter pattern technique EBSP Commercial names for the automation include Orientation Imaging Microscopy OIMTM and Automated Crystal Orientation Mapping ACOM
