Angioplasty K.R. Karsch,K.K. Haase,2013-03-09 Since the development of the first laser generator by Maiman in 1960 laser energy has gained increased interest and has subsequently been used in various fields of application Due to its high energy density combined with a sharply defined irradiation field laser has aroused great expectations especially since laser beams have been used very successfully in various fields especially technology and medicine Medical and surgical applications of the laser were among the first and have been of undisputed benefit in for example ophthalmologic interventions such as coagulation of the retina or for endoscopic tumorectomy in the bronchial gastrointestinal and urogenital tracts Consequently considerable research effort was made to also apply laser techniques in interventional cardiology for the treatment of atherosclerosis aimed at removing plaque material from stenosed tissue or occluded arteries and recanalizing tough and calcified segments unsuitable for the well established technique of balloon dilatation Ablating atheroma rather than pushing it aside was thought to achieve better results However it was found that the laser may create rough edged cuts partly with substantial thermal or mechanical damage to the surrounding tissue consequently provoking preconditions for unwanted restenosis Different types of laser generators and probes have therefore been investigated in arterial vessels mostly focusing on indirect laser effects Intravascular probes with laser heated metal tips were used as well as balloon catheters with an incorporated laser fiber designed to heat the surrounding tissue outside the balloon and to ineffectively iron out the plaque

Kochs, A.J. Camm, 2012-12-06 Since the introduction of balloon angioplasty for the relief of coronary artery stenoses and of anginal symptoms in patients with coronary artery disease by Andreas Grintzig in 1977 the field of interventional technology and treatment strategies has grown enormously For the reduction of hemodynamically significant coronary artery stenoses balloon angioplasty is the standard and reference method with a high primary success and low complication rate Because of the relatively high recurrence rates of 30 40% of balloon angioplasty a whole family of different angioplasty techniques has been developed since then Among those are atherectomy devices laser angioplasty radiofrequency angioplasty high and low speed rotational angioplasty and stenting of stenosed vessels Balloon angioplasty has been extended to aortic and mitral valve stenoses and supraventricular and ventricular tachycardias can now be treated by catheter ablation techniques In 1989 an International Symposium on standard and newer interventional techniques has been held at the University of Ulm This volume contains the essential parts and presentations of the international faculty of experts in the field In four chapters the principles advantages pitfalls and future developments of coronary angioplasty angioplasty of peripheral arteries balloon valvuloplasty and of catheter ablation of supraventricular and ventricular tachycardias are described in detail We hope that this State of the Art representation will be of great value for both the non expert reader and the active researcher in the fields addressed within the book V Hombach M Kochs and A J Camm ix List of contributors U U **Coronary Artery Disease** James T. Coronary Stents Ulrich Sigwart, George I. Frank, 2012-12-06 Over the past 15 years a multitude of new transluminal techniques have been developed all designed to broaden the range of indications and improve the results of angioplasty Among these the implantation of intravascular stents has emerged as the technique with the greatest promise It has become clear that stenting not only successfully deals with the problem of abrupt closure after angioplasty but also reduces the incidence of restenosis the Achilles heel of angioplasty The reason why restenosis is reduced may be because the immediate gain of luminal diameter is greater with stenting than with any other technique Even if the late loss of diameter is similar among most currently used transluminal techniques the end result will still be better after stenting because of the nearly ideal primary effect The aims of this book are twofold first it presents a state of the art summary of the progress made in stenting so far and secondly it details some of the prospects for future improvement The concept of stenting has proved to be a correct one and therefore all future efforts will be directed towards new safe and biologically friendly stents BERRY & KOHN'S OPERATING ROOM TECHNIQUE: FIRST SOUTH ASIA EDITION - E-book Nancymarie Phillips, 2016-08-02 This new edition of this classic perioperative text has addressed changing roles needs and evolving technologies while maintaining the fundamental focus that still remains valid the care of the surgical patient This edition of the text identifies the knowledge and skill needs of the caregiver and strives to incorporate components of patient care from preoperative intraoperative and postoperative practice areas A systems approach is introduced to help organize patient care to minimize the risk for human error

Modern Surgical Care Thomas A. Miller, 2006-08-15 Completely updated with contributions by world leaders in surgery and the surgery specialties this reference assists surgeons in the diagnosis and treatment of patients by considering disease as a derangement of normal physiology thus allowing the surgeon to correlate the appropriate use of laboratory and radiologic modalities Arranged according to specific organ systems the book is easily accessible and reflects the impact that scientific discoveries and technical advances have had on our understanding of the physiologic processes in surgical patients
