In the movies, many characters heal very quickly after getting hurt. Some, like Wolverine or Rapunzel, even have special healing powers. However, when a person gets hurt in real life, it may take a lot of patience and hard work to get better. People who are recovering from an injury may also need support from the community and care from healthcare and educational professionals. In particular, it takes time and hard work to recover after a traumatic brain injury (TBI). People with TBI work with a special group of professionals, called a rehabilitation team, to get better. In this article, we will learn about a boy named Dante, who had a TBI after falling off his bicycle. We will learn what happened in Dante's brain after he got hurt and how his rehabilitation team helped him after his TBI. We will finish up by talking about how you can help people with TBI in your community.

Even though you cannot see your brain, it is the most complicated part of your body. Your brain controls how you move, think, and experience the world. It controls things that you do intentionally, like the words

to guide treatment practitioners not only in methods for evaluating traumatic brain injury in adults and Regenerative Medicine in China Xiaobing Fu, 2021-06-30 This book includes major issues in wound tissue repair and regeneration in 14 chapters The topics start from cytological basis molecular and genetic basis skin development to the tissue repair visceral injury and tissue engineering In the second part it introduces Chinese researchers contribution in wound repair and regeneration Specially it has 3 chapters discussing new technologies in tissue repair and regeneration and 1 chapter in Traditional Chinese Medicine *Brain Injury as a Neurodegenerative Disorder* Robin E.A. Green, 2017-04-20 It has been long assumed that following the resolution of acute injuries traumatic brain injury represents a stable neural entity However there is growing evidence that a single moderate severe brain injury may instead trigger an ongoing deteriorative process that commences sub acutely and occurs regardless of age For scientists and clinicians it is critical to examine this body of evidence and to explore its implications Do the findings represent a neurodegenerative process or can they be alternatively explained What are the neural behavioural and functional characteristics of this progressive deterioration Such information is needed to develop treatments to prevent or mitigate decline and to inform the clinical care of brain injured patients Research and clinical practice are influenced by the assumption that moderate severe TBI is non progressive with few studies exploring treatments to prevent progression and rehabilitation typically concentrated in the early stages of injury Brain injuries can never be fully prevented However understanding that such progressive deterioration occurs opens a novel area of research prevention of secondary decline offering new possibilities for the improvement of long term outcomes in people with traumatic brain injury
